-  **800,000+** Satisfied Customers

**QUESTION 1**

You are developing a customer information application for a pay television company. The customer's home telephone number is used as the account number for the customer. Clerks must be able to update the telephone number in case of changes or data entry errors.

A data entry clerk will typically open several forms from the Customers form that are synchronized with the currently selected customer using a global variable containing the telephone number.

Although you also need to modify the other forms, what two triggers should you code in the Customers form to keep the forms synchronized in case the data entry clerk updates the telephone number or selects a different customer? (Choose two.)

- A. Pre-Query
- B. Post-Query
- C. Key-Next-Record
- D. When-New-Record-Instance
- E. When-Validate-Item for the phone number item
- F. When-New-Item-Instance for the phone number item

Correct Answer: DE

QUESTION 2

Which two statements about FORM_TRIGGER_FAILURE are true? (Choose two).

- A. You cannot raise FORM_TRIGGER_FAILURE in an exception handler.
- B. FORM_TRIGGER_FAILURE does not cause an unhandled exception.
- C. FORM_TRIGGER_FAILURE causes a trigger to fail in a controlled manner.
- D. If you use FORM_TRIGGER_FAILURE to fail a trigger that is called by another trigger, the calling trigger automatically fails.
- E. Processing continues after FORM_TRIGGER_FAILURE is raised until the end of the PL/SQL block that contains it.
- F. You must code an exception handler to define how you want the FORM_TRIGGER_FAILURE exception to function.

Correct Answer: BC

QUESTION 3

Which three statements best describe a Table of Records in Forms Builder? (Choose three.)

- A. A Table of Records enables you to query and update multiple tables, and perform validation, on the server side.
- B. A Table of Records is not efficient in terms of network traffic, because multiple round trips are required for all the records to be returned.
- C. Array processing cannot be used when a data block is based on a stored procedure that returns a Table of Records.
- D. A stored procedure that uses a Table of Records can be used only as a DML block datasource.
- E. A stored procedure that uses a Table of Records can be used as both a query and DML block datasource.
- F. A stored procedure that uses a Table of Records can be used only as a query block datasource.

Correct Answer: ACE

QUESTION 4

Some forms that you wrote have been through part of the testing cycle. One of the testers has reported encountering a navigation trap in your Orders form in which the cursor apparently is tuck?between two items. Which scenario could have caused the navigation trap?

- A. The Pre-Form trigger validates the user and time of day and also contains the code:GO_ITEM(\ORDERS.Date_Ordered\'); This is an illegal call to a restricted built-in, resulting in the navigation trap.
- B. Two adjacent text items have When-New-Item-Instance triggers that fail when executed. This left the internal cursor with no place to go when the tester attempted to navigate to them, and there was a fatal error for the form.
- C. A Pre-Text-Item trigger allows the focus into the text item the first time it is executed, but subsequent execution raises a FORM_TRIGGER_FAILURE. A Pre-Text-Item trigger on a different text item also fails.
- D. The Next Navigation Data Block and Previous Navigation Data Block properties of the Orders and Order_Items blocks have been set so that the focus cannot move to the Inventories block.
- E. A When-Validate-Item trigger on a text item validates the contents of the wrong field, and you have coded a GO_ITEM() that sends the focus back to the item that invoked it.
- F. The Next Navigation Item and Previous Navigation Item properties of some text items have been set so that the user is stuck in an infinite navigation loop.

Correct Answer: C

QUESTION 5

You should enable the user to add additional values to a list item at run time. You must also ensure that the Record Group LOCATIONS, which is used to populate the list item, can be updated with any user-supplied value.

What two actions could you take to accomplish this? (Choose two.)

- A. Add a new value to the list item by calling the POPULATE_LIST built-in.
- B. Add a new value to LOCATIONS by calling the POPULATE_GROUP built-in.
- C. Add a new value to the list item by calling the ADD_LIST_ELEMENT built-in.
- D. Remove duplicate values in LOCATIONS by calling the DELETE_LIST_ELEMENT built-in.
- E. Add a new value to LOCATIONS by calling the ADD_GROUP_ROW and SET_GROUP_CHAR_CELL built-ins.
- F. Add a new value to LOCATIONS by calling the ADD_GROUP_ROW and SET_GROUP_NUMBER_CELL built-ins.

Correct Answer: CE
