QUESTION 1

Which statement is true about editing adapter InteractionSpec endpoint properties with Enterprise manager Fusion Middleware Control?

- A. InteractionSpec properties can be added or removed, but they take effect only after the composite is retired and activated.
- B. Adapter endpoint property values can be changed, but they take effect only after the composite is retired and activated.
- C. Adapter endpoints property values can be changed, and they take effect without retiring and activating the composite.
- D. InteractionSpec property values cannot be changed.

Correct Answer: C

*

The InteractionSpec or ActivationSpec Properties Properties in this group require the adapter endpoint to be recycled. The values of properties in this group can be changed from the EM console. However, property-dependency constraint validation requires that Oracle JDeveloper be used to make changes (adding or removing) to the composition of these properties.

*

The InteractionSpec or ActivationSpec Properties These properties require the adapter endpoint to be recycled. For properties in this group, you can change their values from the EM console. However, to change the composition (add or remove) of these properties, you must use Oracle JDeveloper because of property-dependency constraint validation.

QUESTION 2

How are task outcomes processed in a BPEL process?

- A. Each path out of the human task activity has a condition in which you specify the outcome that causes that path to be followed.
- B. With onMessage or pick activities that receive the outcome from the human workflow engine.
- C. With a switch containing a case for each outcome of interest plus an optional otherwise case after the human task activity.
- D. With a switch containing one case for each possible outcome after the human task.

Correct Answer: C

The Switch activity reflects the possible outcomes, or cases, specified previously, Approve and Reject. It also has an Otherwise case to represent other outcomes, such as errored, stale, or expired. Inside each of the cases, you can add activities to complete modeling of the business process.

Note:

*

Human Task editor--A tool that enables you to specify task settings such as task outcome, payload structure, task participants, assignment and routing policy, expiration and escalation policy, notification settings, and so on.

*

Task outcomes capture the possible outcomes of a task. The Oracle BPEL Worklist Application displays the outcomes you specify here as the possible actions to perform during run time. You can specify the following types of task outcomes:

Select a seeded outcome Enter a custom outcome

*

The Outcomes window displays the possible outcomes for tasks. APPROVE and REJECT are selected by default.

QUESTION 3

Composite X invokes an outbound DB adapter to write data to a database table. You have configured JCA at the binding component as follows:

2 2 You have also modeled a modeled a fault policy to retry the invocation three times in case of remoteFault as follows:

3 3

Which result describes what happens when the database that is being accessed by the above binding component goes

down?

- A. The invocation is retrieved for a total of two times every two seconds. Fault policy retries are ignored.
- B. The invocation is retried for a total of six times every three seconds.
- C. The invocation is retried for a total of six times every two seconds.
- D. The fault policy retries occur within the JCA retries. So two JCA retries are executed two seconds apart. Within each JCA retry, three fault policy retries are executed three seconds apart.
- E. The JCA retries occur within the fault policy retries. So three fault policy retries are executed three seconds apart. Within each fault policy retry, two JCA retries are executed two seconds apart.

Correct Answer: E

Note:

*

Global retries for any error handling are returned to the BPEL Receive activity instance, for example, or, more generally, to the point at which the transaction started. Such a retry could occur if there was an error such as a temporary database fault. The default retry count is by default indefinite, or specified in the `jca.retry.count` property.

*

Properties you can specify in the `composite.xml` file include:

`/jca.retry.count`

Specifies the maximum number of retries before rejection. Again, specifying this value is a pre-requisite to specifying the other property values.

`/jca.retry.interval`

Specifies the time interval between retries (measured in seconds.)

* A `remoteFault` is also thrown inside an activity. It is thrown because the invocation fails. For example, a SOAP fault is returned by the remote service.

QUESTION 4

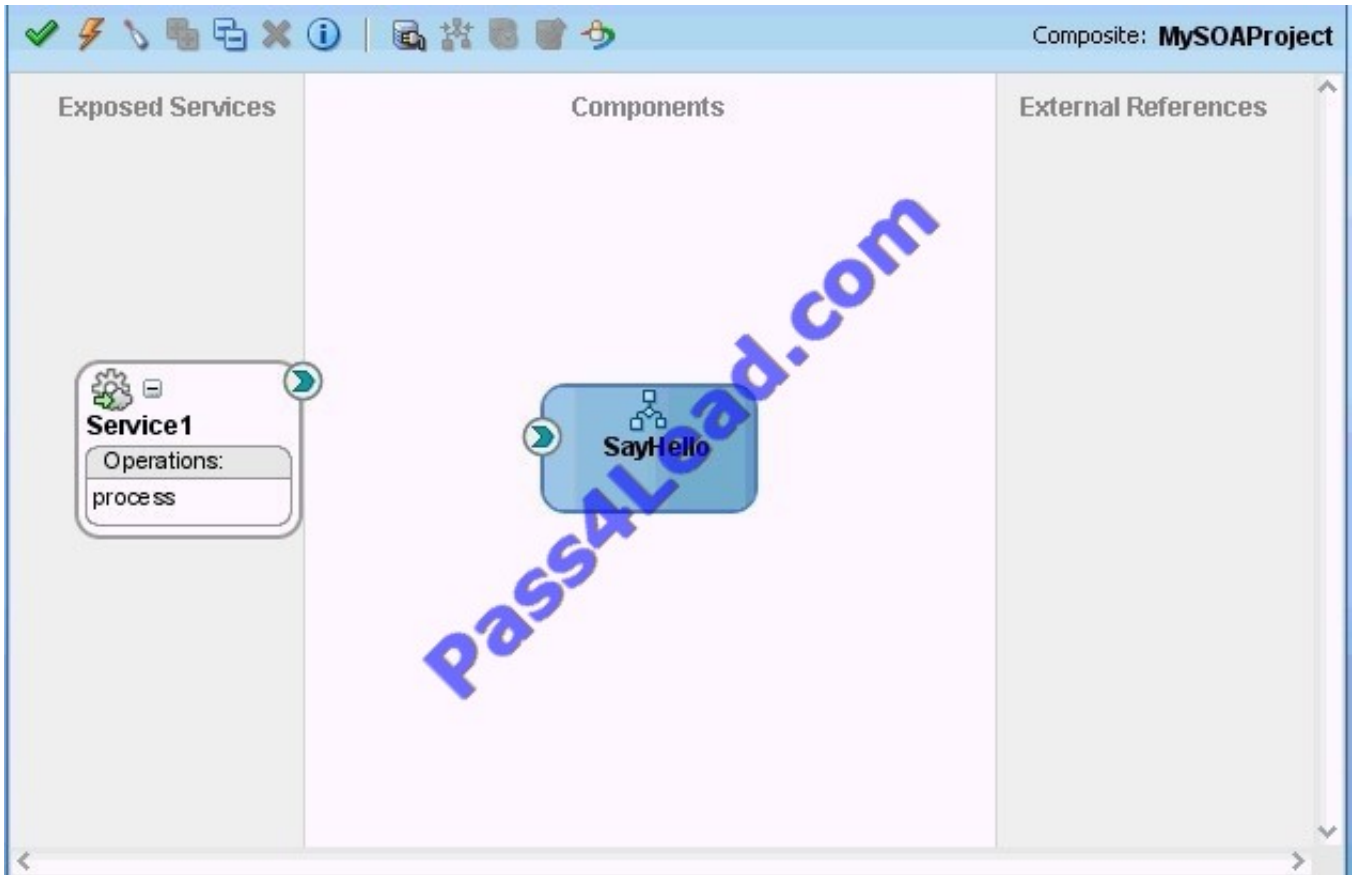

Identify two fundamental terms in Service Component Architecture (SCA) that are represented visually in the SOA Composite Editor.

- A. Application
- B. Entry point
- C. Component
- D. Wire
- E. External call

Correct Answer: CD

C: SOA Composite Editor:

D: You wire (connect) the web service and BPEL process service component. Example Wire Connection:

Note:

* SOA composite applications consist of the following parts:

Service binding components Composites Service components Reference binding components Wires

QUESTION 5

Which two features are provided by decision tables?

- A. Sets of input data can be bucketed and reviewed for gaps.
- B. Data sets can be reviewed for conflicts.
- C. Data can be used for only one rule evaluation.
- D. A rule evaluation can be used only to enter new output data.

Correct Answer: AB

After you create a Decision Table there are operations that you may want to perform on the Decision Table, including the following:

(A)

Find and fix gaps in a Decision Table

(B)

Finding and resolving conflicts between rules in a Decision Table Compact or split cells in a Decision Table Merge a condition or split a condition in a Decision Table

A: * Compact the Decision Table

In this step you compact the rules to merge from eighteen rules to nine rules. This automatically eliminates the rules that are not needed and preserves the no gap, no conflict properties for the Decision Table.

* The Conditions area in a Decision Table includes one or more condition rows. Each condition row has a condition expression and, for each rule, a condition cell. A condition expression is an expression that you build in Rules Designer. The condition expression is often a fact property or a function result, but it can be any expression that has a type that can be associated with a bucketset.

B: A Decision Table displays multiple related rules in a single spreadsheet-style view. In Rules Designer a Decision Table presents a collection of related business rules with condition rows, rules, and actions presented in a tabular form that is easy to understand. Business users can compare cells and their values at a glance and can use Decision Table rule analysis features by clicking icons and selecting values in Rules Designer to help identify and correct conflicting or missing cases.
