100% Passing Guarantee
100% Money Back Assurance

Following Questions and Answers are all new published by VMware
Official Exam Center

-  **Instant Download** After Purchase
-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

**QUESTION 1**

How does fault tolerance provide continuous availability?

- A. By providing the availability required by most applications running in virtual machines, independent of the operating system and application running in it.
- B. By using a feature called Changed Block Tracking (CBT), which backs up content.
- C. By creating and maintaining a secondary virtual machine that is identical to primary machine.
- D. By using the host as the medium to provide asynchronous replication of datastores.

Correct Answer: C

Explanation: VMware Fault Tolerance provides continuous availability for virtual machines by creating and maintaining a Secondary VM that is identical to, and continuously available to replace, the Primary VM in the event of a failover situation.

QUESTION 2

After creating virtual machine backups using vSphere Data Protection, you decide to perform a simple verification of those backups. Which feature will you use for this?

- A. vSphere Replication
- B. Changed Block Tracking
- C. VMware Tools heartbeat
- D. Verification scripts

Correct Answer: C

Explanation: VMware Tools heartbeat, used for simple verification Reference: http://blogs.vmware.com/vsphere/files/2013/12/ABV_technical_white_paper.pdf

QUESTION 3

How does Storage Replication handle data replication without a dedicated link between various storage sites?

- A. By using storage I/O control for replication of datastores.
- B. By Using the host as a medium to provide asynchronous replication of datastores.
- C. By using volume level mirroring.
- D. By using storage vMotion.

Correct Answer: D

Explanation: vSphere Storage vMotion Yes You can move the disk files of a replicated virtual machine on the source
Reference: <http://pubs.vmware.com/vsphere-replication-60/topic/com.vmware.ICbase/PDF/vsphere-replication-60-admin.pdf>

QUESTION 4

What does Storage DRS do to determine if a particular disk device is overburdened?

- A. Powers down the storage device.
- B. Monitors disk I/O latency on the shared storage devices.
- C. Takes a count of virtual machines on the storage device.
- D. Reads the data on the storage devices.

Correct Answer: B

Reference: <http://www.vmware.com/files/pdf/techpaper/vsphere-storage-drs- interoperability.pdf>

QUESTION 5

A network administrator notices that a few virtual machines run slowly every morning. To troubleshoot the issue the administrator needs to analyze the total traffic sent I virtual machines. Which feature would the administrator use for troubleshooting?

- A. Virtual LANs
- B. Traffic Shaping
- C. NetFlow
- D. Port Mirroring

Correct Answer: D

Explanation: I would like to clarify few things in this blog entry about the Port-mirroring feature that is available on vSphere Distributed Switch (VDS). This feature is similar to the port mirroring capability available on the physical switches. Network administrators can use this feature to troubleshoot any network related issues in the virtual infrastructure and monitor virtual_machine-to-virtual_machine traffic that is flowing on the same ESXi host. Network administrators use network analyzer tool, which captures traffic, along with the port mirror feature to perform monitoring and troubleshooting activities. In the physical network, depending on where the analyzer or debug tool is placed in the network, network administrators choose different port mirroring options. The following are some of the standard port mirroring options available on physical switches Reference:<http://blogs.vmware.com/vsphere/2012/06/how-to-use-port-mirroring-feature-ofvds-for-monitoring-virtual-machine-traffic.html>
