Which type of authentication is used initially by a controller-based AP so that a guest client can get an IP address?

A. 802.1x

B. EAP

C. LEAP

D. open authentication

E. TLS

F. SSL

Correct Answer: D

Open authentication allows any device to authenticate and then attempt to communicate with the access point. Using open authentication, any wireless device can authenticate with the access point, but the device can communicate only if its Wired Equivalent Privacy (WEP) keys match the access point\\'s WEP keys. Devices that are not using WEP do not attempt to authenticate with an access point that is using WEP. Open authentication does not rely on a RADIUS server on your network. http://www.cisco.com/c/en/us/td/docs/routers/access/wireless/software/guide/SecurityAuthenticationTy pes.html#wp1035025
