QUESTION 1

Which proprietary voice client-server protocol sends traffic back to Cisco Unified Communications Manager with every digit pressed on the endpoint?

- A. H.323 Protocol
- B. Media Gateway Control Protocol
- C. Session Initiation Protocol
- D. Skinny Client Control Protocol

Correct Answer: D

QUESTION 2

Drag the statement from the left to the protocol name that is associated with it on the right.

Select and Place:

Drag the statement from the left to the protocol name that is associated with it on the right.

Provides a separate flow from RTP for transport use by UDP.	cRTP
Dynamic port usage makes it difficult to traverse firewalls.	sRTP
Is recommended for slow speed links of up to 768 kb/s.	RTP
Provides encryption, message authentication and integrity, and replay protection.	RTCP

Correct Answer:

Drag the statement from the left to the protocol name that is associated with it on the right.

	cRTP Is recommended for slow speed links of up to 768 kb/s.
	SRTP Provides encryption, message authentication and integrity, and replay protection.
	RTP Ephemeric port usage makes it difficult to traverse firewalls.
	RTCP Provides a separate flow from RTP for transport use by UDP.

Explanation/Reference:

The Real-Time Transport Protocol (RTP) is an Internet protocol standard that specifies a way for programs to manage the real-time transmission of multimedia data over either unicast or multicast network services. RTP is commonly used in Internet telephony applications. RTP does not in itself guarantee real-time delivery of multimedia data; it does, however, provide the wherewithal to manage the data as it arrives to best effect. RTP combines its data transport with a control protocol (RTCP), which makes it possible to monitor data delivery for large multicast networks. When protocols are used in conjunction, RTP is originated and received on even port numbers and the associated RTCP communication uses the next higher odd port number. Monitoring allows the receiver to detect if there is any packet loss and to compensate. The Secure Real-time Transport Protocol (or SRTP) defines a profile of RTP (Real-time Transport Protocol), intended to provide encryption, message authentication and integrity, and replay protection to the RTP data in both unicast and multicast applications. Since RTP is closely related to RTCP (Real Time Control Protocol) which can be used to control the RTP session, SRTP also has a sister protocol, called Secure RTCP (or SRTCP); SRTCP provides the same security-related features to RTCP, as the ones provided by SRTP to RTP. Utilization of SRTP or SRTCP is optional to the utilization of RTP or RTCP; but even if SRTP/SRTCP are used, all provided features (such as encryption and

authentication) are optional and can be separately enabled or disabled. The only exception is the message authentication feature which is indispensably required when using SRTCP.

On slow links, it may be advantageous to compress the IP/UDP/RTP headers using Compressed RTP (cRTP). If you use cRTP then the 40 bytes of overhead incurred by the IP/UDP/RTP

headers can typically be compressed down to 2 to 4 bytes (2 bytes when no UDP checksums are sent, and 4 bytes when checksums are sent). Enabling compression on both ends of a lowbandwidth serial link can greatly reduce the network

overhead if it carries a lot of RTP traffic.

cRTP is supported on serial lines using Frame Relay, HDLC, or PPP encapsulation. It is also supported over ISDN interfaces. CRTP should not be used on links greater than 2 Mbps.

**QUESTION 3**

What is the command sequence to configure an FXS port as a signal loop-start?

- A. router(config)# voice-port slot/port router(config-voiceport)# signal loopstart router(config-voiceport)# shutdown router(config-voiceport)# no shutdown
- B. router(config)# voice-port slot/port router(config-voiceport)# signal loopstart
- C. router(config)# voice-port slot/port router(config-voiceport)# signal groundstart router(config-voiceport)# shutdown router(config-voiceport)# no shutdown
- D. router(config)# voice-port slot/port router(config-voiceport)# signal groundstart

Correct Answer: A

QUESTION 4

What is the purpose of a COR list?

- A. to identify the incoming call leg with the highest priority
- B. to create a set of dial peers for IP phones
- C. to restrict the ability of phones to make certain types of calls
- D. to list a detailed configuration for an IP phone and voice port

Correct Answer: C

QUESTION 5

Refer to the exhibit. When 5551234 is being matched with the outgoing dial peer that is shown in the exhibit, which of the following called numbers will be sent to the VoIP network?

```
dial-peer voice 1 pots
destination-pattern 555....
prefix 5
port 0/0/0:23
```

- A. 5551234
- B. 1234
- C. 555
- D. Null
- E. 5

F. 51234

Correct Answer: D
