QUESTION 1

Your company has a private cloud that is managed by using a System Center 2012 Operations Manager infrastructure.

You have a distributed application named App1. App1 has the following service level objectives (SLOs):

At least 99.9 percent uptime

No more than 85 percent average CPU utilization

You need to add the SLOs that monitor the required information to Service Level Tracking.

Which SLO or SLOs should you add? (Each correct answer presents part of the solution. Choose all that apply.)

- A. Monitor state SLO - Availability
- B. Monitor state SLO - Security
- C. Collection rule SLO
- D. Monitor state SLO - Performance
- E. Monitor state SLO - Configuration

Correct Answer: AC

<http://technet.microsoft.com/en-us/library/hh230719.aspx>

To define a service level objective for an application Open the Operations console with an account that is a member of the Operations Manager Administrators user role.

Click Authoring.

In the navigation pane, expand Management Pack Objects, and then click Service Level Tracking.

In the Tasks pane, click Create.

In the Service Level Tracking dialog box, type a name for the service level that you are defining. For example, type LOB Application 1. Optionally, you can provide a description. Click Next. On the Objects to Track page, under Targeted class,

click Select.

In the Select a Target Class dialog box, select a class for the service level, such as Distributed Application, from the list in the text box. You can search for a class by typing its name into the Look For text box. Click OK to close the Select a

Target dialog box. You can use the Scope option to specify the scope for the service level. The default selection is to use all objects of the targeted class.

Select the management pack that this service level will be saved in. You can use an existing management pack or create a new one.

Click Next.

On the Service Level Objectives page, click Add, and then click Monitor state SLO to create a new monitor.

This monitor will track the availability of the application.

Define the state monitor as follows:

In the Service level objective name text box, type a name for the service level objective. For this scenario, type Availability.

From the Monitor drop-down list, choose the specific monitor that you want to use to measure the objective. For this scenario, choose Availability. Using the Service level objective goal (%) spin box, provide the numerical measure for your

objective. For example, select 99.990 to indicate that your goal is 99.99% availability. You can refine what the monitor tracks to determine availability by selecting or clearing any of the following state criteria:

Unplanned maintenance

Unmonitored

Monitoring unavailable

Monitor disabled

Planned maintenance

Warning

Click OK.

On the Service Level Objectives page, click Add, and then click Collection rule SLO to create a new collection rule. This rule will track the performance of the application Define the performance collection rule as follows:

In the Service level objective name: text box, type a name for the service level objective. For this scenario, type Performance. Under Targeted class, click Select to open the Select a Target Class dialog box. Specify the target class for the rule

from the list of targets in the text box. Note that this class must be contained in the distributed application.

For this scenario, select the specific class the rule is targeted to, such as Windows Server 2008 Operating System.

Under Performance collection rule, click Select to open the Select a Rule dialog box. Specify the performance collection rule to use. For this scenario, choose Collect Processor\ % Processor Time performance counter, and then click OK.

Using one of the Aggregation method options, choose one of the following:

Average

Min

Max

Use the Service level objective goal drop-down list to specify either Less than or More than, and enter a value in the adjacent text box. For this scenario, choose Less Than and 80. This indicates that the performance goal is to never exceed

80% processor time.

Click OK.

On the Service Level Objectives page, click Next.

On the Summary page, review the settings, and then click Finish.

When the Completion page appears, click Close.

QUESTION 2

Your role of Systems Administrator at ABC.com includes the management of the company's private cloud.

The private cloud is hosted on an internal System Center 2012 infrastructure. The network includes servers that run Windows Server 2008 R2 Hyper-V and are managed by servers running System Center 2012 - Virtual Machine Manager

(VMM).

You are configuring a hardware profile in VMM.

The hardware profile will be used to create virtual machines configured for Windows Network Load Balancing.

In the Network Adapter Properties, you configure the network adapter to be connected to a logical network and to use a Static IP address from the Static IP Pool.

You now need to configure the MAC address options.

Which two of the following options should you configure? (Choose two).

- A. You should select the option for a Dynamic MAC Address.
- B. You should select the option for a Static MAC Address.
- C. You should tick the Enable Spoofing of MAC Addresses checkbox.
- D. You should clear the Enable Spoofing of MAC Addresses checkbox.

Correct Answer: BC

In order for NLB service to function properly, it will assign all clustered NIC the same MAC address. It cannot do this if spoofing is disabled, so answer C is valid. Additionally, we want to make sure that once the MAC addresses are set by NLB, they don't change, this means answer B is valid. <http://technet.microsoft.com/en-us/library/bb742455.aspx>
<http://blogs.technet.com/b/jhoward/archive/2009/05/21/new-in-hyper-v-windows-server-2008-r2-part-2-macspoofing.aspx> (Since VMM is an abstraction to hyperv, we can assume hyperV NLB requirements are the same as VMM NLB requirements.)

QUESTION 3

You deploy a new virtual machine named VM29 for App1.

You view VM29 from the Operations Manager console.

You discover that VM29 is not visible when viewing the health of App1.

You need to ensure that VM29 is visible when viewing the health of App1.

What should you do?

- A. Edit the application monitoring rules.
- B. Run a network devices discovery rule.
- C. Run an Active Directory server discovery rule.
- D. Edit the distributed application design.

Correct Answer: D

QUESTION 4

Your network contains a System Center 2012 R2 Service Manager deployment.

You plan to create priority-based service level objectives (SLOs) for all work item types. The priorities will be assigned automatically based on the urgency and the impact of a work item.

You need to identify how to implement the priorities for each work item.

What should you identify? In the table below, identify which work items can be implemented by using the work item settings or a custom workflow and which work items can be implemented only by using a custom workflow. Make only one

selection in each row.

Hot Area:

Work item	Can be implemented by using the work item settings or a custom workflow	Can be implemented only by using a custom workflow
Activity	<input type="checkbox"/>	<input type="checkbox"/>
Change Request	<input type="checkbox"/>	<input type="checkbox"/>
Incident	<input type="checkbox"/>	<input type="checkbox"/>
Problem	<input type="checkbox"/>	<input type="checkbox"/>
Release	<input type="checkbox"/>	<input type="checkbox"/>
Service Request	<input type="checkbox"/>	<input type="checkbox"/>

Correct Answer:

Work item	Can be implemented by using the work item settings or a custom workflow	Can be implemented only by using a custom workflow
Activity	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Change Request	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Incident	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Problem	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Release	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Service Request	<input type="checkbox"/>	<input checked="" type="checkbox"/>

QUESTION 5

Your company has a private cloud that is managed by using a System Center 2012 infrastructure. The company defines the Service Level Agreement (SLA) for a web application as 99 percent uptime.

You need to create service level objectives (SLOs) that meet the SLA requirement.

Which object or objects should you create from the Service Manager Console? (Each correct answer presents part of the solution. Choose all that apply.)

- A. A queue
- B. A connector
- C. A channel
- D. A calendar
- E. A metric
- F. A subscription

Correct Answer: ADE

In SCSM 2012 the Service Level Management offers a great opportunity to implement SLAs for different IT management processes. With the four components of SLA management you can build your own complex SLAs: Queues ->Which work items are covered in the SLA Calendar -> The service hours of an SLA Metrics ->What is
