QUESTION 1

Your network contains an Active Directory domain named contoso.com. The domain contains two member servers named Server1 and Server2. Server1 and Server2 have the Hyper-V server role installed. Server2 is configured as Hyper-V replica of Server1.

Server1 hosts two virtual desktops named VM1 and VM2. VM1 and VM2 are replicated to Server2.

VM1 and VM2 host a distributed application named App1. App1 has its own authentication mechanism.

You need to verify whether the replicated virtual machines are configured properly. The solution must maintain the availability of App1.

Which three actions should you perform? To answer, move the three appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create a virtual switch on Server1.	
On the replicas of VM1 and VM2, modify the network adapter settings.	
On the replicas of VM1 and VM2, invoke Test Failover.	
On VM1 and VM2, modify the network adapter settings.	
Create a virtual switch on Server2.	
On VM1 and VM2, invoke a planned failover.	

Correct Answer:

Actions	Answer Area
Create a virtual switch on Server1.	Create a virtual switch on Server2.
	On the replicas of VM1 and VM2, modify the network adapter settings.
	On the replicas of VM1 and VM2, invoke Test Failover.
On VM1 and VM2, modify the network adapter settings.	
On VM1 and VM2, invoke a planned failover.	

QUESTION 2

You need to recommend a solution to deliver the virtualized applications to the client computers. The solution must meet the application requirements.

What should you include in the recommendation?

- A. Enhanced Storage
- B. BranchCache
- C. File Replication Service (FRS)
- D. Distributed File System (DFS)

Correct Answer: D

QUESTION 3

Your network contains an Active Directory domain named contoso.com.

You use Microsoft Application Virtualization (App-V) 5.0 to package and deploy applications to the network.

You need to deploy an application named App1. The solution must ensure that an add-on for App1 is also installed.

Which five actions should you perform? To answer, move the five appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create a connection group.	
Sequence the add-on.	
Sequence App1.	
Publish the packages.	
Add the packages to the publishing server.	
Publish the connection group.	

Correct Answer:

Actions	Answer Area
	Sequence App1.
	Sequence the add-on.
	Add the packages to the publishing server.
Publish the packages.	Create a connection group.
	Publish the connection group.

Box 1: Sequence App1

First sequence the application.

Box 2: Sequence the add-on

Then sequence the add-on.

Box 3: Add the packages to the publishing server.

Box 4: Create a connection group.

App1 and the add-on are added to the connection group.

Box 5: Publish the connection group.

Note:

* At a high level, virtual applications management with Configuration Manager requires sequencing applications, distributing virtual applications to end-users and client devices using Configuration Manager deployments, and finally, publishing those applications for use.

* Connection Groups group one or more App-V packages to enable member applications in these packages to interact with one another while maintaining isolation from the rest of the system. This gives sequencing engineers the flexibility to maintain packages independently and removes the redundancy of adding the same application several times onto a machine.

* The Microsoft Application Virtualization (App-V) 5.0 Sequencer enables you to create the following three types of virtualized application packages: Standard application Add-on or plug-in Middleware

QUESTION 4

Your company has a main office and 10 branch offices. Each branch office connects to the main office by using a low-bandwidth WAN link.

All servers run Windows Server 2012. All client computers run Windows 8.

You plan to deploy 20 new line-of-business applications to all of the client computers.

You purchase 5,000 client licenses for the line-of-business applications.

You need to recommend an application distribution solution. The solution must be able to meet the following requirements:

Download application installation files from a server in the local site. Generate reports that contain information about the installed applications. Generate administrative alerts when the number of installed applications exceeds the number of purchased licenses.

What should you include in the recommendation? More than one answer choice may achieve the goal. Select the BEST answer.

- A. Applications published as RemoteApp programs
- B. Assigned applications by using Group Policy objects (GPOs)
- C. Applications deployed by using Microsoft System Center 2012 Configuration Manager
- D. Published applications by using Microsoft Application Virtualization (App-V) publishing servers

Correct Answer: C

QUESTION 5

Your company has three offices named Office1, Office2, and Main1. The offices do not have a network connection to each other. The offices are configured as shown in the following table.

Office	Configuration
Main1	Contains client computers, servers, and domain controllers.
Office1	Contains only client computers.
Office2	Contains client computers and servers. All servers are members of a workgroup.

You plan to deploy Microsoft Application Visualization (App-V) 5.0 to the network. Only Main1 requires App-V streaming.

You need to identify the appropriate App-V infrastructure model for each office.

Which infrastructure model should you identify? To answer, drag the appropriate infrastructure model to the correct requirement in the answer area. Each infrastructure model may be used once, more than once, or not at all. Additionally, you

may need to drag the split bar between panes or scroll to view content.

Select and Place:

Infrastructure Models	Answer Area
Standalone	Main1: Infrastructure model
Full infrastructure	Office1: Infrastructure model
None	Office2: Infrastructure model

Select and Place:

Infrastructure Models	Answer Area
Standalone	Main1: Infrastructure model
Full infrastructure	Office1: Infrastructure model
None	Office2: Infrastructure model

Correct Answer:

Infrastructure Models	Answer Area
Standalone	Main1: Full infrastructure
Full infrastructure	Office1: Standalone
None	Office2: Standalone

Main1: Full Infrastructure

The Full Infrastructure Model provides for built-in software distribution, management, and reporting capabilities; it also includes the streaming of applications.

Office1: Standalone

The Standalone Model allows virtual applications to be Windows Installer-enabled for distribution without streaming.

Office2: Standalone

The Standalone Model allows virtual applications to be Windows Installer-enabled for distribution without streaming.

Note:

* The three models for distribution are:

1)Standalone Model. The Standalone Model allows virtual applications to be Windows Installer- enabled for distribution without streaming.

2)Streaming Model. The Streaming Model offers application streaming without requiring Active Directory or a database; it enables administrators to stream from existing servers or via System Center Configuration Manager 2007 SP1 with R2

distribution points.

3)Full Infrastructure Model. The Full Infrastructure Model provides for built-in software distribution, management, and reporting capabilities; it also includes the streaming of applications.

All models require a Microsoft Application Virtualization client to be installed on the workstation or RD Session Host server. More details on each of the options are given below.

* The following roles, while required, are not covered in detail since they have no significant infrastructure architecture discussion requirements:

Active Directory Domain Services, for user authentication and application security management.

A client or server running the Microsoft Application Virtualization Management Console.

A sequencer for creating the virtualized application packages. Since the application packages can be shared between instances, not all instances require a sequencer. App-V client installed on systems that require application virtualization:

desktops, virtual machines (VMs), or RD Session Host servers.
