QUESTION 1

You have an application named App1. You have a parameter named @Count that uses the int data type. App1 is configured to pass @Count to a stored procedure.

You need to create a stored procedure named usp_Customers for App1 that returns only the number of rows specified by the @Count parameter.

The solution must NOT use BEGIN, END, or DECLARE statements.

Part of the correct Transact-SQL statement has been provided in the answer area.

Correct Answer: Please review the part for this answer

```
CREATE PROCEDURE usp_Customers @Count int SELECT TOP(@Count) Customers.LastName FROM Customers  
ORDER BY Customers.LastName
```

QUESTION 2

You have a data warehouse that contains the data for all the customers of your company.

You need to create a query dynamically generates a SELECT statement from a table named CUSTOMERS. The SELECT statement must generate a full list of columns.

Part of the correct Transact-SQL has been provided in the answer area below. Enter the code in the answer area that resolves the problem and meets the stated goals or requirements. You can add code within the code that has been

provided as well as below it.

```
CREATE VIEW sales.uv_CustomerFullNames  
AS SELECT  
FirstName,  
LastName  
FROM Sales.Customers
```

```
1 SELECT 'SELECT' +  
2     STUFF ((  
3         SELECT ', [' + name + ']'  
4         FROM  
5         WHERE id = OBJECT_ID('Customers') AND  
6             name <> 'id'  
7         FOR  
8         (''), 1, 1, '' ) +  
9     'FROM [Customers]'
```

Correct Answer: XML PATH

In line 7 add XML PATH to get the following line:

```
FOR XML PATH (''), 1, 1, '' +
```

Here is how it works:

1. Get XML element string with FOR XML

Adding FOR XML PATH to the end of a query allows you to output the results of the query as XML elements, with the element name contained in the PATH argument. For example, if we were to run the following statement:

```
SELECT ',' + name
```

```
FROM temp1
```

```
FOR XML PATH ('')
```

By passing in a blank string (FOR XML PATH('')), we get the following instead:

```
,aaa,bbb,ccc,ddd,eee
```

2. Remove leading comma with STUFF

The STUFF statement literally "stuffs" one string into another, replacing characters within the first string. We, however, are using it simply to remove the first character of the resultant list of values.

```
SELECT abc = STUFF( (
```

```
SELECT ',' + NAME
```

```
FROM temp1
```

```
FOR XML PATH('')
```

```
), 1, 1, '')
```

```
FROM temp1
```

Note: The full code will be:

```
SELECT 'SELECT' +
```

```
STUFF ((
```

```
SELECT ',' + name + ''
```

```
FROM
```

```
WHERE id = OBJECT_ID('Customers') AND
```

```
...name 'me'
```

```
FOR XML PATH (''), 1, 1, '' +
```

```
'FROM[Customers]'
```

**QUESTION 3**

You are a database developer of a Microsoft SQL Server database.

The database contains a table named Instructor that has the following definition:

```
CREATE TABLE Instructor
(InstructorID int NOT NULL PRIMARY KEY,
InstructorName varchar(255) NOT NULL)
```

You are designing a new table named Course that has the following definition:

```
CREATE TABLE Course
(CourseID int NOT NULL PRIMARY KEY,
InstructorID int NOT NULL,
CourseName varchar(255) NOT NULL,
CourseDescription varchar(MAX) NOT NULL)
```

You need to ensure that the InstructorId column in the Course table contains only values that exist in the InstructorID column of the Instructor table. Which Transact-SQL statement should you use?

- A.
ALTER TABLE Course
ADD CONSTRAINT PK_Course_InstructorID PRIMARY KEY (InstructorID)
- B. ALTER TABLE Instructor
ADD CONSTRAINT FK_Instructor_InstructorID FOREIGN KEY (InstructorID)
REFERENCES Course (InstructorID)
- C. ALTER TABLE Course
ADD CONSTRAINT FK_Course_InstructorID FOREIGN KEY (InstructorID)
REFERENCES Instructor (InstructorID)
- D. ALTER TABLE Instructor
ADD CourseID int NOT NULL;
ALTER TABLE Instructor
ADD CONSTRAINT FK_Instructor_CourseID FOREIGN KEY (CourseID)
REFERENCES Course (CourseID);
- E. ALTER TABLE Course
ADD CONSTRAINT CK_Course_InstructorID
CHECK (InstructorID IN (SELECT InstructorID FROM Instructor))

A. Option A

B. Option B

C. Option C

D. Option D

E. Option E

Correct Answer: C

QUESTION 4

You use Microsoft SQL Server 2012 to develop a database application. You need to create an object that meets the following requirements.

-Takes an input parameter.

-Returns a table of values.

-

Can be referenced within a view. Which object should you use?

A.

inline table-valued function

B.

user-defined data type

C.

stored procedure

D.

scalar-valued function

Correct Answer: A

Incorrect answers:

Not B: A user-defined data type would not be able to take an input parameter.

Not C: A stored procedure cannot be used within a view.

Not D: A scalar-valued would only be able to return a single simple value, not a table.

QUESTION 5

How can you support the SELECT clause of a query by using a nonclustered index that is already used for the WHERE clause?

A. You could use SELECT *.

B. You could modify the index that is already used to include the columns from the select list that are not part of the key.

C. You could add column aliases.

D. There is no way to support the SELECT clause with indexes.

Correct Answer: B
