**QUESTION 1**

You define a table by using the following statement.

```
CREATE TABLE School.dbo.Teachers
(
    ID INT PRIMARY KEY,
    Teacher XML
)
```

The Teachers table contains one million records. A sample record of the XML data output is as follows:

```
<teacher>
  <id>12345</id>
  <name>Elementary Teacher1</name>
  <grade>5</grade>
  <subjects>
    <subject>English</subject>
    <subject>Math</subject>
  </subjects>
</teacher>
```

You plan to create queries against the table based on grade.

You need to recommend which indexes should be applied to the XML fields. The solution must meet the following requirements: Reduce the amount of time required to query the table based on grade. Minimize the size of the index.

What should you recommend? To answer, drag the appropriate index types to the correct fields. Each index type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Select and Place:

Index Types

- No index
- Primary XML index
- Secondary XML index
- Selective XML index

Answer Area

Grade:

Id:

Subject:

Correct Answer:

Index Types

-
-
-
- Selective XML index

Answer Area

Grade:

Id:

Subject:

QUESTION 2

You need to recommend a solution to allow application users to perform tables. The solution must meet the business requirements.

What should you recommend?

- A. Create a Policy-Based Management Policy.
- B. Create a user-defined database role and add users to the role.
- C. Create stored procedures that use EXECUTE AS clauses.
- D. Create functions that use EXECUTE AS clauses.

Correct Answer: D

* EXECUTE AS Clause (Transact-SQL)

In SQL Server you can define the execution context of the following user-defined modules:

functions (except inline table-valued functions), procedures, queues, and triggers.

QUESTION 3

You need to recommend a solution to minimize the amount of time it takes to execute USP_5. What should you include in the recommendation?

- A. Enable cross-database chaining.
- B. Use a server role to group all logins.
- C. Use the EXECUTE AS clause in USP_5.
- D. Copy USP.5 to each database.

Correct Answer: A

*

scenario: A stored procedure named USP_5 changes data in multiple databases. Security checks are performed each time USP_5 accesses a database.

*

Cross-database ownership chaining occurs when a procedure in one database depends on objects in another database. A cross-database ownership chain works in the same way as ownership chaining within a single database, except that an unbroken ownership chain requires that all the object owners are mapped to the same login account. If the source object in the source database and the target objects in the target databases are owned by the same login account, SQL Server does not check permissions on the target objects.

QUESTION 4

You are troubleshooting an application that runs a query. The application frequently causes deadlocks.

You need to identify the isolation level used by the query when a deadlock occurs.

What should you do?

More than one answer choice may achieve the goal. Select the BEST answer.

- A. Query the sys.dm_exec_requests dynamic management view.
- B. Create a trace in SQL Server Profiler that contains the Deadlock graph event.
- C. Query the sys.dm_exec_sessions dynamic management view.
- D. Enable trace flag 1222, and then view the SQL Server error log.

Correct Answer: C

* sys.dm_exec_sessions Returns one row per authenticated session on SQL Server. sys.dm_exec_sessions is a server-scope view that shows information about all active user connections and internal tasks. Include the column: transaction_isolation_level smallint Transaction isolation level of the session. 0 = Unspecified 1 = ReadUncomitted 2 = ReadCommitted 3 = Repeatable 4 = Serializable 5 = Snapshot Is not nullable. Reference: sys.dm_exec_sessions (Transact-SQL)

QUESTION 5

You have an SQL Server 2014 server.

You plan to create four stored procedures that will use transactions. The stored procedures will be configured as shown in the following table.

Stored procedure name	Concurrency strategy
SP1	A transaction will only recognize data changes made before the start of the transaction. Other transactions are allowed to modify data.
SP2	A transaction can read data made from another transaction that has not been committed.
SP3	A transaction can only read data made from another transaction that has been committed.
SP4	During a transaction, no other transactions can modify data.

You need to recommend an isolation level for each stored procedure. The solution must support the concurrency strategy of each stored procedure and must minimize locks.

What should you recommend? To answer, drag the appropriate isolation levels to the correct stored procedures. Each isolation level may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll

to view content.

Select and Place:

Isolation Levels

READ COMMITTED

READ UNCOMMITTED

REPEATABLE READ

SERIALIZABLE

SNAPSHOT

Answer Area

SP1: Isolation level

SP2: Isolation level

SP3: Isolation level

SP4: Isolation level

Correct Answer:

Isolation Levels

READ UNCOMMITTED

Answer Area

SP1:	SNAPSHOT
SP2:	REPEATABLE READ
SP3:	READ COMMITTED
SP4:	SERIALIZABLE
