**QUESTION 1**

You need to implement the business requirements for managing customer data. What should you do? (Choose 2)

- A. Add a class named Catalog to the Controllers folder. Then add a method named EditCustomer to the class.
- B. Add a folder named Customer to the Views folder. Then create a view inside this folder named Edit.aspx.
- C. Add a class named CustomerController to the Controllers folder. Then add a method named Edit to the class.
- D. Add a folder named EditCustomer to the Views folder. Then create a view inside this folder named Catalog.aspx.

Correct Answer: BC

QUESTION 2

You are designing an HTML5 website.

You need to design the interface such that the content is viewable in all types of browsers, including screen readers.

What should you do? (Each correct answer presents a complete solution. Choose all that apply.)

- A. Ensure that content elements have valid and descriptive names.
- B. Use Resource Description Framework (RDF) to describe content elements.
- C. Convert HTML forms to XForms.
- D. Use HTML5 semantic markup elements.
- E. Annotate content elements with Accessible Rich Internet Application (ARIA) attributes.

Correct Answer: DE

QUESTION 3

You are developing an ASP.NET MVC application that provides instant messaging capabilities to customers. You have the following requirements:

- Messages must be able to be sent and received simultaneously.
- Latency and unnecessary header data must be eliminated.
- The application must comply with HTML5 standards.

You need to design the application to meet the requirements.

What should you do?

- A. Configure polling from the browser.
- B. Implement long-running HTTP requests.
- C. Implement WebSockets protocol on the client and the server.
- D. Instantiate a MessageChannel object on the client.

Correct Answer: D

QUESTION 4

HOTSPOT

You are developing an ASP.NET MVC application that will be hosted on Microsoft Azure.

The application includes the StackExchange.Redis client package. A variable named CacheConnectionConfiguration stores the cache endpoint URL and the password to

connect to the cache.

The application must store a user's color selection by using the Azure Redis cache. The cached value must expire after 90 minutes. You need to cache the user's color selection.

How should you complete the relevant code? To answer, choose the appropriate code segment from each list in the answer area.

Hot Area:

Answer Area

```
private static void CacheColorSelection(string colorSelection)
{
    var connection = ConnectionMultiplexer.Connect(CacheConnectionConfiguration);
    [Dropdown]
    var cache = connection.Configure();
    var cache = connection.GetStatus();
    var cache = connection.GetDatabase();
    var cache = connection.GetServer(CacheConnectionConfiguration);
    [Dropdown]
    cache.SetString(colorSelection, "color");
    cache.SetString("color", colorSelection);
    cache.SetString("color", colorSelection, TimeSpan.FromMinutes(90));
    cache.SetString("color", colorSelection, TimeSpan.FromSeconds(90));
}
```

Correct Answer:

Answer Area

```
private static void CacheColorSelection(string colorSelection)
{
    var connection = ConnectionMultiplexer.Connect(CacheConnectionConfiguration);
    var cache = connection.Configure();
    var cache = connection.GetStatus();
    var cache = connection.GetDatabase();
    var cache = connection.GetServer(CacheConnectionConfiguration);

    cache.SetString(colorSelection, "color");
    cache.SetString("color", colorSelection);
    cache.SetString("color", colorSelection, TimeSpan.FromMinutes(90));
    cache.SetString("color", colorSelection, TimeSpan.FromSeconds(90));
}
```

Box 1: var cache = connection.GetDatabase();

Once the connection is established, return a reference to the redis cache database by calling the ConnectionMultiplexer.GetDatabase method.

Box 2: cache.SetString("color", colorSelection, TimeSpan.FromMinutes(90));

The TimeSpanFromMinutes method returns a TimeSpan that represents a specified number of minutes, where the specification is accurate to the nearest millisecond.

Example: The following code snippet shows how to set an expiration time of 90 minutes on a key.

```
// Add a key with an expiration time of 90 minutes
```

```
await cache.SetStringAsync("data:key1", 99, TimeSpan.FromMinutes(90));
```

QUESTION 5

- Catch any first chance exceptions thrown by the default app domain.
- Display the name of the app domain that caused the exception.
- Display the message for the exception.

You are developing an ASP.NET MVC application You must handle any first chance exceptions that the application throws. The exception handler has the following requirement

1.

Catch any first chance exceptions thrown by the default app domain.

2.

Display the name of the app domain that caused the exception.

3.

Display the message for the exception. You need to implement the exception handler. How should you complete the relevant code?

Select and Place:

Code segments

- FirstChanceExceptionEventArgs
- FriendlyName
- FirstChanceException
- SystemException
- AppDomain
- System
- SystemExceptionEventArgs

Answer Area

```

class FirstChanceExceptionTest
{
    static void Handler(object src,  )
    {
        Console.WriteLine("FirstChanceException raised in {0}: {1}",
            , CurrentDomain, ,
            e.Exception.Message);
    }
    static void Main()
    {
        , CurrentDomain, 
        = Handler;
    }
}

```

Correct Answer:

Code segments

FirstChanceExceptionEventArgs
FriendlyName
FirstChanceException
SystemException
AppDomain
System
SystemExceptionEventArgs

Answer Area

```
class FirstChanceExceptionTest
{
    static void Handler(object src, FirstChanceExceptionEventArgs e)
    {
        Console.WriteLine("FirstChanceException raised in {0}: {1}",
            AppDomain.CurrentDomain.FriendlyName,
            e.Exception.Message);
    }
    static void Main()
    {
        AppDomain.CurrentDomain.FirstChanceException +=
            Handler;
    }
}
```

Note: Example code with inline lambda expression for the handler:

```
class Example
{
    static void Main()
    {
        AppDomain.CurrentDomain.FirstChanceException +=
            (object source, FirstChanceExceptionEventArgs e) =>
            {
                Console.WriteLine("FirstChanceException event raised in {0}: {1}",
                    AppDomain.CurrentDomain.FriendlyName, e.Exception.Message);
            };
    }
}
```

Example with handler defined separately:

```
static void FirstChanceHandler(object source, FirstChanceEventArgs e)
{
    Console.WriteLine("FirstChanceException event raised in {0}: {1}",
        AppDomain.CurrentDomain.FriendlyName, e.Exception.Message);
}
```
