QUESTION 1

Note: This question is part of a series of questions that present the same scenario. Each question on the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while

others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You manage an Azure SQL Database. The database has weekly backups that are stored in an Azure Recovery Services vault.

You create an Azure Recovery Services vault and download the backup agent installation file. You need to complete the installation of the backup agent.

What should you do first?

- A. Configure network throttling.
- B. Set the storage replication option.
- C. Download the vault credentials file.
- D. Select the data to back up.

Correct Answer: C

Steps include: create a vault, prepare your infrastructure to back up files and folders by downloading and installing the Microsoft Azure Recovery Services agent, downloading vault credentials, and then using those credentials to register the agent with the vault.

QUESTION 2

You are designing a solution to secure a company's Azure resources. The environment hosts 10 teams. Each team manages a project and has a project manager, a virtual machine (VM) operator, developers, and contractors.

Project managers must be able to manage everything except access and authentication for users. VM operators must be able to manage VMs, but not the virtual network or storage account to which they are connected. Developers and contractors must be able to manage storage accounts.

You need to recommend roles for each member.

What should you recommend? To answer, drag the appropriate roles to the correct employee types. Each role may be used once, more than once, or not at all.

You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

	Employee type	Role
Owner		
Contributor	Project manager	Role
Reader	VM operators	Role
Virtual Machine Contributor	Developers	Role
Storage Account Contributor	Contractors	Role

Correct Answer:

	Employee type	Role
Owner		
Contributor	Project manager	Contributor
Reader	VM operators	Virtual Machine Contributor
Virtual Machine Contributor	Developers	Storage Account Contributor
Storage Account Contributor	Contractors	Storage Account Contributor

QUESTION 3

You are migrating an on-premises application to Azure. One component of the application is a legacy Windows native executable that performs image processing.

The image processing application must run every hour. During times that the image processing application is not running, it should not be consuming any Azure compute resources.

You need to ensure that the image processing application runs correctly every hour.

Solution: Create an Azure WebJob that runs the image processing application every hour.

Does the solution meet the goal?

- A. Yes
- B. No

Correct Answer: B

Azure Web Job is focusing on doing background job for Azure Website. It's working daemon web server farm in cloud. Instead use the Azure Scheduler. Reference: <https://docs.microsoft.com/en-ca/azure/scheduler/scheduler-intro>

QUESTION 4

A company has a hybrid environment. The public IP address of the on-premises environment is 40.84.199.233. The company deploys virtual machines (VMs) to Azure on different subnets.

You need to ensure that the Azure VMs can communicate with the on-premises environment.

What should you create?

- A. a local vNet rule for each subnet
- B. a user defined route to 0.0.0.0/0 with a VPN gateway
- C. an Internet rule for each subnet
- D. a user defined route to 255.255.255.0/0 with a VPN gateway

Correct Answer: C

QUESTION 5

You manage a cloud service that hosts a customer-facing application. The application allows users to upload images and create collages. The cloud service is running in two medium instances and utilizes Azure Queue storage for image processing.

The storage account is configured to be locally redundant. The sales department plans to send a newsletter to potential clients. As a result, you expect a significant increase in global traffic.

You need to recommend a solution that meets the following requirements:

*

Configure the cloud service to ensure the application is responsive to the traffic increase.

*

Minimize hosting and administration costs.

What are two possible ways to achieve this goal? Each correct answer presents a complete solution

A.

Configure the cloud service to run in two Large instances.

B.

Configure the cloud service to auto-scale to three instances when processor utilization is above 80%.

C.

Configure the storage account to be geo-redundant

D.

Deploy a new cloud service in a separate data center. Use Azure Traffic Manager to load balance traffic between the cloud services.

E.

Configure the cloud service to auto-scale when the queue exceeds 1000 entries per machine.

Correct Answer: BE

An autoscaling solution reduces the amount of manual work involved in dynamically scaling an application. It can do this in two different ways: either preemptively by setting constraints on the number of role instances based on a timetable, or reactively by adjusting the number of role instances in response to some counter(s) or measurement(s) that you can collect from your application or from the Azure environment.
