**QUESTION 1**

You plan to create a Linux virtual machine on an Azure Stack integrated system.

You download an Ubuntu Server image.

Which authentication method can use to access the Linux virtual machine by using SSH?

- A. The Extensible Authentication Protocol (EAP)
- B. a Kerberos token
- C. a service principal
- D. a password

Correct Answer: D

When you create you Linux VM via the portal or the CLI, you have two authentication choices. If you choose a password for SSH, Azure configures the VM to allow logins via passwords. If you chose to use an SSH public key, Azure configures the VM to only allow logins via SSH keys and disables password logins. To secure your Linux VM by only allowing SSH key logins, use the SSH public key option during the VM creation in the portal or CLI.

QUESTION 2**DRAG DROP**

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the

scenario is exactly the same in each question in this series.

Start of repeated scenario.

Your network contains an Active Directory forest named contoso.com

You deploy an Azure Stack integrated system named Prod to a production environment. You also deploy an Azure Stack integrated system named Dev to a development environment. The developers who access Dev change frequently.

The Azure Stack integrated systems and the contoso.com forest are federated.

The on-premises network contains a Hyper-V host that hosts a Red Hat Enterprise Linux virtual machine named Linux1. Linux1 has the following characteristics:

1.
A 2-TB disk
- 2.

Generation 1

3.

10 virtual cores

4.

128 GB of RAM

5.

A disk named LinuxVhd.vhdx

You plan to deploy infrastructure as a service (IaaS) to Dev for developer projects. The Marketplace on Dev is configured and ready to publish items. Dev contains one plan named Dev_Plan1 and one offer named Dev_Offer1.

Prod contains two plans and two offers. One of the offers is named Offer1.

All the IaaS and platform as a service (PaaS) tenant data must be backed up to an external location. The solution must ensure that the data can be restored if the datacenter that hosts Prod becomes unavailable.

End of repeated scenario.

You need to prepare a custom image based on Linux1 that will be deployed to Prod. The solution must prevent any changes to the current disk of Linux1.

Which four cmdlets should you run in sequence? To answer, move the appropriate cmdlets from the list of cmdlets to the answer area and arrange them in the correct order.

NOTE: More than one order of answer choices is correct. You will receive credit for any of the correct orders you select.

Select and Place:

Cmdlets

- Set-VHD
- Copy-Item
- New-VHD
- Convert-VHD
- Set-VM
- Stop-VM
- Resize-VHD
- Copy-VMFile

Answer Area

www.Pass4Lead.com

Correct Answer:

Cmdlets

- Set-VHD
-
- New-VHD
-
- Set-VM
-
-
- Copy-VMFile

Answer Area

- Stop-VM
- Copy-Item
- Resize-VHD
- Convert-VHD

Azure Stack does not support the VHDX format. Azure supports only fixed VHD. You can use Hyper-V Manager to convert the disk to VHD format, or you can use the convert-vhd cmdlet.

The maximum size that's allowed for the VHD is 1,023 GB.

QUESTION 3

NOTE: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution,

while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You have several Azure Stack integrated systems.

A new Azure Stack operator joins your team.

You create a new user named AzStackOp1 that the new operator will use to manage the systems.

AzStackOp1 attempts to create a new plan and receives the following error message: "Failed to submit deployment. Error submitting the deployment request. Additional details from the underlying API that might be helpful: The client

`AzStackOp1@onmicrosoft.com\\' with object id `03f4f6a8-0bb5 does not have authorization to perform action..."

You need to ensure that AzStackOp1 can create plans and offers. The solution must prevent AzStackOp1 from delegating RBAC rights to other users.

Solution: You assign AzStackOp1 Contributor rights to the Default Provider Subscription.

Does this meet the goal?

A. Yes

B. No

Correct Answer: A

QUESTION 4

HOTSPOT

You have an Azure Stack integrated system.

You need to install the Azure Stack-compatible Azure PowerShell modules on a management workstation.

You set the \$profile variable to the correct API version.

Which commands should you run? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

```
Install-Module -Name 

|                      |
|----------------------|
| AzureRm.BootStrapper |
| AzureRmProfile       |
| AzureStack           |

 -Force
```

```

|                       |
|-----------------------|
| Get-AzureRmProfile    |
| Select-AzureRmProfile |
| Use-AzureRmProfile    |

 -Profile profile$ -Force
```

Correct Answer:

Answer Area

```
Install-Module -Name 

|                      |
|----------------------|
| AzureRm.BootStrapper |
| AzureRmProfile       |
| AzureStack           |

 -Force
```

```

|                       |
|-----------------------|
| Get-AzureRmProfile    |
| Select-AzureRmProfile |
| Use-AzureRmProfile    |

 -Profile profile$ -Force
```

QUESTION 5

You have an Azure Stack integrated system.

You need to view the public IP address used by tenants. The solution must include the list of dynamically and statically assigned IP addresses.

Which blade should you review from the Azure Stack administrator portal?

- A. Offers
- B. Resource providers > Health
- C. Virtual networks
- D. Resource providers > Network

Correct Answer: D
