**QUESTION 1**

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario.

Your company has a main office in New York and a branch office in Toronto. Each office has a dedicated connection to the Internet. Each office has a firewall that uses inbound and outbound rules.

The company has an on-premises network that contains several datacenters. The datacenters contain multiple hypervisor deployments, including Windows Server 2016 Hyper-V. The network uses Microsoft System Center for monitoring and

Windows Azure Pack for self-service.

The company has a Microsoft Azure subscription that contains several workloads. You use Azure Resource Manager templates and other automated processes to create and manage the resources in Azure.

You have an Azure Stack integrated system in the New York office. The company has a development team in the Toronto office and a development team in the New York office. The system has an offer named Offer1. Several tenants have

subscriptions based on Offer1.

You have a Hyper-V host named Server1 that runs Windows Server 2012 R2. Server1 is used for testing. The hardware on Server1 can support the deployment of the Azure Stack Development Kit.

You have a Generation 1 virtual machine named VM1 that runs Windows Server 2012 R2. VM1 is deployed to a Hyper-V host that runs Windows Server 2016. VM1 has a fixed size disk named VM1.vhdx that is 200 GB.

End of repeated scenario.

The development team in the Toronto office fails to access the Azure Stack integrated system. The team successfully accesses the Azure subscriptions. The development team in the New York office successfully accesses the Azure Stack

integrated system.

You need to ensure that the Toronto development team can access the system.

What should you do?

- A. For the Toronto development team, allow the inbound endpoints of the Azure Stack infrastructure on the New York office firewalls.
- B. Create a site-to-site VPN connection from Azure to the New York office.
- C. For the Toronto development team, allow ports 4443 and 8080 on the New York firewalls.
- D. Configure and enable iDNS.

Correct Answer: B

QUESTION 2

Note: This question is part of a series of questions that use the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

Start of repeated scenario.

Your network contains an Active Directory forest named contoso.com

You deploy an Azure Stack integrated system named Prod to a production environment. You also deploy an Azure Stack integrated system named Dev to a development environment. The developers who access Dev change frequently.

The Azure Stack integrated systems and the contoso.com forest are federated.

The on-premises network contains a Hyper-V host that hosts a Red Hat Enterprise Linux virtual machine named Linux1. Linux1 has the following characteristics:

A 2-TB disk Generation 1 10 virtual cores 128 GB of RAM A disk named LinuxVhd.vhdx

You plan to deploy infrastructure as a service (IaaS) to Dev for developer projects. The Marketplace on Dev is configured and ready to publish items. Dev contains one plan named Dev_Plan1 and one offer named Dev_Offer1.

Prod contains two plans and two offers. One of the offers is named Offer1.

All the IaaS and platform as a service (PaaS) tenant data must be backed up to an external location. The solution must ensure that the data can be restored if the datacenter that hosts Prod becomes unavailable.

End of repeated scenario.

You need to recommend a backup strategy for Prod.

Which two technologies should you include in the recommendation? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Microsoft Azure Backup
- B. a blob snapshot
- C. AzCopy
- D. a virtual machine checkpoint

Correct Answer: AC

References: <https://docs.microsoft.com/en-us/azure/backup/backup-mabs-files-applications-azure-stack>

QUESTION 3

You have an Azure Stack integrated system that has a SQL Server resource provider.

You need to remove the resource provider.

Which three types of objects should you delete before you run the deployment script? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. user databases
- B. Default Subscription Provider
- C. storage accounts
- D. hosting servers
- E. plans

Correct Answer: ADE

To remove the SQL resource provider, it is essential to first remove any dependencies:

1.

Ensure that you have the original deployment package that you downloaded for this version of the SQL resource provider adapter.

2.

All user databases must be deleted from the resource provider. (Deleting the user databases doesn't delete the data.) This task should be performed by the users themselves.

3.

The administrator must delete the hosting servers from the SQL resource provider adapter.

4.

The administrator must delete any plans that reference the SQL resource provider adapter.

5.

The administrator must delete any SKUs and quotas that are associated with the SQL resource provider adapter.

6.

Rerun the deployment script with the following elements: The -Uninstall parameter The Azure Resource Manager endpoints The DirectoryTenantID The credentials for the service administrator account

References: <https://docs.microsoft.com/en-us/azure/azure-stack/azure-stack-sql-resource-provider-remove>

QUESTION 4

You have an Azure stack integrated system.

You already have several Microsoft Azure Marketplace images downloaded.

Several tenants request that a Microsoft SQL Server 2014 Service Pack 2 (SP2) Enterprise on Windows Server 2012 R2 image be available in the Azure Stack Marketplace.

You need to meet the request by using the least amount of administrative effort.

What should you do?

- A. From Azure Marketplace, deploy a SQL Server 2014 SP2 Enterprise on Windows Server 2012 R2 image, copy the VHD file to Azure Stack, and then publish the image to the Azure Stack Marketplace.
- B. Create a new virtual machine that runs Windows Server 2012 R2, install SQL Server 2014 SP2 Enterprise, and then publish the image to the Azure Stack Marketplace.
- C. From Marketplace Management, click Add from Azure, and then download the SQL Server 2014 SP2 Enterprise on Windows Server 2012 R2 image.
- D. Create a new virtual machine image based on an existing SQL Server 2014 SP2 Enterprise virtual machine, upload the image to the Azure Stack Marketplace, and then publish the image for all users.

Correct Answer: C

References: <https://docs.microsoft.com/en-us/azure/azure-stack/azure-stack-download-azure-marketplace-item>

QUESTION 5

You have an Azure Stack integrated system.

A tenant requires assistance managing a subscription.

The tenant needs to create a custom RBAC role definition.

What should you instruct the tenant to do?

- A. Establish a PowerShell session to the Azure Resource Manager (user) endpoint. Run the `New-AzureRmPolicySetDefinition` cmdlet and the `New-AzureRoleTemplate` cmdlet.
- B. Establish a PowerShell session to the Azure Resource Manager (user) endpoint. Create a JSON file that contains the permission definitions. Run the `New-AzureRmRoleDefinition` cmdlet.
- C. Establish a PowerShell session to the Azure Resource Manager (administrator) endpoint. Create an XML file that contains the permission definitions. Run the `New-AzureRmRoleDefinition` cmdlet.
- D. Establish a PowerShell session to the Azure Resource Manager (administrator) endpoint. Run the `New-AzureRmPolicySetDefinition` cmdlet and the `New-AzureRoletemplate` cmdlet.

Correct Answer: B

The `New-AzureRmRoleDefinition` cmdlet creates a custom role in Azure Role-Based Access Control. Provide a role definition as an input to the command as a JSON file or a `PSRoleDefinition` object. Incorrect Answers:

A: `New-AzureRoleTemplate` creates web and worker role templates. This has nothing to do with RBAC.

C: The permission definitions should be contained in a JSON file, not an XML file.

D: New-AzureRoleTemplate creates web and worker role templates. This has nothing to do with RBAC.
