-  **800,000+** Satisfied Customers

QUESTION 1

You are integrating BizTalk Server 2010 with a secure Microsoft Windows Communication Foundation (WCF) service that does not have metadata exchange (MEX) enabled. The web service provider distributes an XML schema with a root node named SecretData without a namespace for the data provided by the web service. You generate a BizTalk schema based on the XML schema. You finish developing the application and deploy it for integration testing. When testing the service, you trace the messages received from the service. You see that the response message is within a single element named SecureResponse. SOAP elements wrap the response message and the SecureResponse element. You need to specify the inbound message body properties to ensure that the message can be received.

What should you do?

- A. Choose the Envelope option. Add the soapProcessing endpoint behavior with the property processMessages=True.
- B. Choose the Path option. For the body path expression, specify `/*[local-name()='SecureResponse']/*[local-name()='SecretData']`.
- C. Choose the Path option. For the body path expression, specify `/*[local-name()='SecretData']`. Add the soapProcessing endpoint behavior with the property processMessages=True.
- D. Choose the Body option. Add the useRequestHeadersForMetadataAddress service behavior.

Correct Answer: B

QUESTION 2

A BizTalk Server 2010 solution uses an orchestration that performs several actions. The orchestration uses Expression shapes and Message Assignment shapes. The orchestration has no Scope shapes and the Transaction Type property is set to None. Occasionally, an XLANG exception is thrown in the orchestration. The exception is not handled and the orchestration goes into a suspended state. You need to catch the exception and handle the error.

Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)

- A. Add an exception handler. Set the Exception Object Type property to `Microsoft.XLANGs.BaseTypes.XLANGsException`.
- B. Set the Transaction Type property of the orchestration to Long Running. Set the Compensation property of the orchestration to Default.
- C. Add a Scope shape to the orchestration. Place all Expression and Message Assignment shapes within this scope.
- D. Add an exception handler. Set the Exception Object Type property to `System.SystemException`.

Correct Answer: AC

QUESTION 3

A BizTalk Server 2010 orchestration calls a Business Rules Engine policy. This policy evaluates test scores to determine whether a candidate passes or fails. The BizTalk solution and the policy are deployed. Business users have

decided that the value of a passing score should be raised from 60% to 70%. You need to adjust the policy to reflect the modified rule parameter.

What should you do?

- A. Open the policy in the Business Rules Composer. Create a new version of the policy and edit this version to reflect the changed parameter. Then deploy the new version.
- B. Open the policy in the Business Rules Composer. Create a new version of the policy and edit this version to reflect the changed parameter. Then publish the new version.
- C. Create a new vocabulary in the Business Rules Composer. Add the new parameter to this vocabulary and then publish the vocabulary.
- D. Open the policy in the Business Rules Composer and create a different policy with a new name. Then copy the currently deployed version to the new policy and modify to reflect the changed parameter. Deploy the new policy.

Correct Answer: B

QUESTION 4

A BizTalk Server 2010 solution uses an orchestration to call an external Microsoft .NET assembly. The class on the assembly is not serializable. The Expression shape used to call the .NET assembly is contained within a scope that has its Transaction Type property set to Atomic. The call to the .NET assembly occasionally results in an exception being thrown. You need to handle the exception when it is thrown. Create a new scope with the Transaction Type property set to Long Running.

What should you do next?

- A. Add an exception handler to the new scope. Drag and drop the atomic scope below the new scope.
- B. Add an exception handler to the new scope. Drag and drop the atomic scope above the new scope.
- C. Add an exception handler to the new scope. Drag and drop the atomic scope inside the new scope.
- D. Add a compensation block to the atomic scope. Drag and drop the atomic scope inside the new scope.

Correct Answer: C

QUESTION 5

A company tracks storage containers and integrates radio frequency identification (RFID) readers with a server shipping management system built on BizTalk Server 2010. You define a custom tag event named ContainerArrivedEvent. You use the RFID manager to add the SqlServerSink component to the RFID process. You need to ensure that the SqlServerSink component logs only the custom tag event.

What should you specify for the EventTypes property?

- A. ContainerArrivedEvent

B. the fully qualified assembly name

C. All

D. Generic

Correct Answer: B
