**QUESTION 1**

Your network contains three servers named Server1, Server2, and Server3. Server1 is located on a perimeter network. Server2 and Server3 are accessible from the internal network only.

Users connect to Server2 and Server3 to run RemoteApp programs.

You need to ensure that remote users can run the RemoteApp programs on Server2 and Server3. The solution must minimize the number of ports that must be opened on the internal firewall.

Which role service should you install on Server3?

- A. Remote Desktop Connection Broker (RD Connection Broker)
- B. Remote Desktop Web Access (RD Web Access)
- C. Remote Desktop Gateway (RD Gateway)
- D. Remote Desktop Session Host (RD Session Host)

Correct Answer: C

---

**QUESTION 2**

Your network contains two servers that run Windows Server 2008 R2. The servers are located on different IP subnets. You plan to configure the servers in a two-node failover cluster. You need to select the quorum model for the cluster.

The solution must ensure that users can access the cluster resources if a single node fails.

Which quorum model should you select?

- A. No Majority: Disk Only
- B. Node and Disk Majority
- C. Node and File Share Majority
- D. Node Majority

Correct Answer: C

Quorum configuration choices

You can choose from among four possible quorum configurations:

Node Majority (recommended for clusters with an odd number of nodes) Can sustain failures of half the nodes (rounding up) minus one. For example, a seven node cluster can sustain three node failures.

Node and Disk Majority (recommended for clusters with an even number of nodes) Can sustain failures of half the nodes (rounding up) if the disk witness remains online. For example, a six node cluster in which the disk witness is online could

sustain three node failures. Can sustain failures of half the nodes (rounding up) minus one if the disk witness goes offline or fails. For example, a six node cluster with a failed disk witness could sustain two ( $3-1=2$ ) node failures. Node and File

Share Majority (for clusters with special configurations) Works in a similar way to Node and Disk Majority, but instead of a disk witness, this cluster uses a file share witness.

Note that if you use Node and File Share Majority, at least one of the available cluster nodes must contain a current copy of the cluster configuration before you can start the cluster. Otherwise, you must force the starting of the cluster through

a particular node. For more information, see "Additional considerations" in Start or Stop the Cluster Service on a Cluster Node. No Majority: Disk Only (not recommended) Can sustain failures of all nodes except one (if the disk is online).

However, this configuration is not recommended because the disk might be a single point of failure.

Illustrations of quorum configurations

The following illustrations show how three of the quorum configurations work. A fourth configuration is described in words, because it is similar to the Node and Disk Majority configuration illustration.

Note:

In the illustrations, for all configurations other than Disk Only, notice whether a majority of the relevant elements are in communication (regardless of the number of elements). When they are, the cluster continues to function.

When they are not, the cluster stops functioning.

Two nodes out of three in communication:  
the cluster runs

Individual nodes not in communication:  
the cluster stops

As shown in the preceding illustration, in a cluster with the Node Majority configuration, only nodes are counted when calculating a majority.

Two out of four nodes and witness disk in communication: the cluster runs

Three out of four nodes in communication: the cluster runs

Only one out of four nodes and witness disk in communication: the cluster stops

As shown in the preceding illustration, in a cluster with the Node and Disk Majority configuration, the nodes and the disk witness are counted when calculating a majority.

**Node and File Share Majority Quorum Configuration** In a cluster with the Node and File Share Majority configuration, the nodes and the file share witness are counted when calculating a majority. This is similar to the Node and Disk Majority quorum configuration shown in the previous illustration, except that the witness is a file share that all nodes in the cluster can access instead of a disk in cluster storage.

One node and the disk in communication: the cluster runs

All nodes communicating, but no communication with the disk: the cluster stops

In a cluster with the Disk Only configuration, the number of nodes does not affect how quorum is achieved. The disk is the quorum. However, if communication with the disk is lost, the cluster becomes unavailable. Source: <http://technet.microsoft.com/en-us/library/cc731739.aspx>

### QUESTION 3

Your network contains 10 servers that have the Remote Desktop Session Host (RD Session Host) role service installed.

You install the Remote Desktop Gateway (RD Gateway) role service on a new server.

You need to ensure that users can access the RD Session Host servers by using the RD Gateway.

Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)

- A. Create a Remote Desktop resource authorization policy (RD RAP).
- B. Create a Remote Desktop connection authorization policy (RD CAP).
- C. Install the RD Session Broker role service.
- D. Install the Remote Desktop Web Access (RD Web Access) role service.

Correct Answer: AB

#### QUESTION 4

Quota Path	% Used	Limit	Quot...	Source Template	Match Te...	Descri...
<b>Source Template: (2 items)</b>						
D:\FTP1	0%	900 MB	Hard			
D:\FTP2	0%	500 MB	Hard			

Your network contains a server that has Microsoft SharePoint Foundation 2010 installed.

You need to back up the server farm configuration.

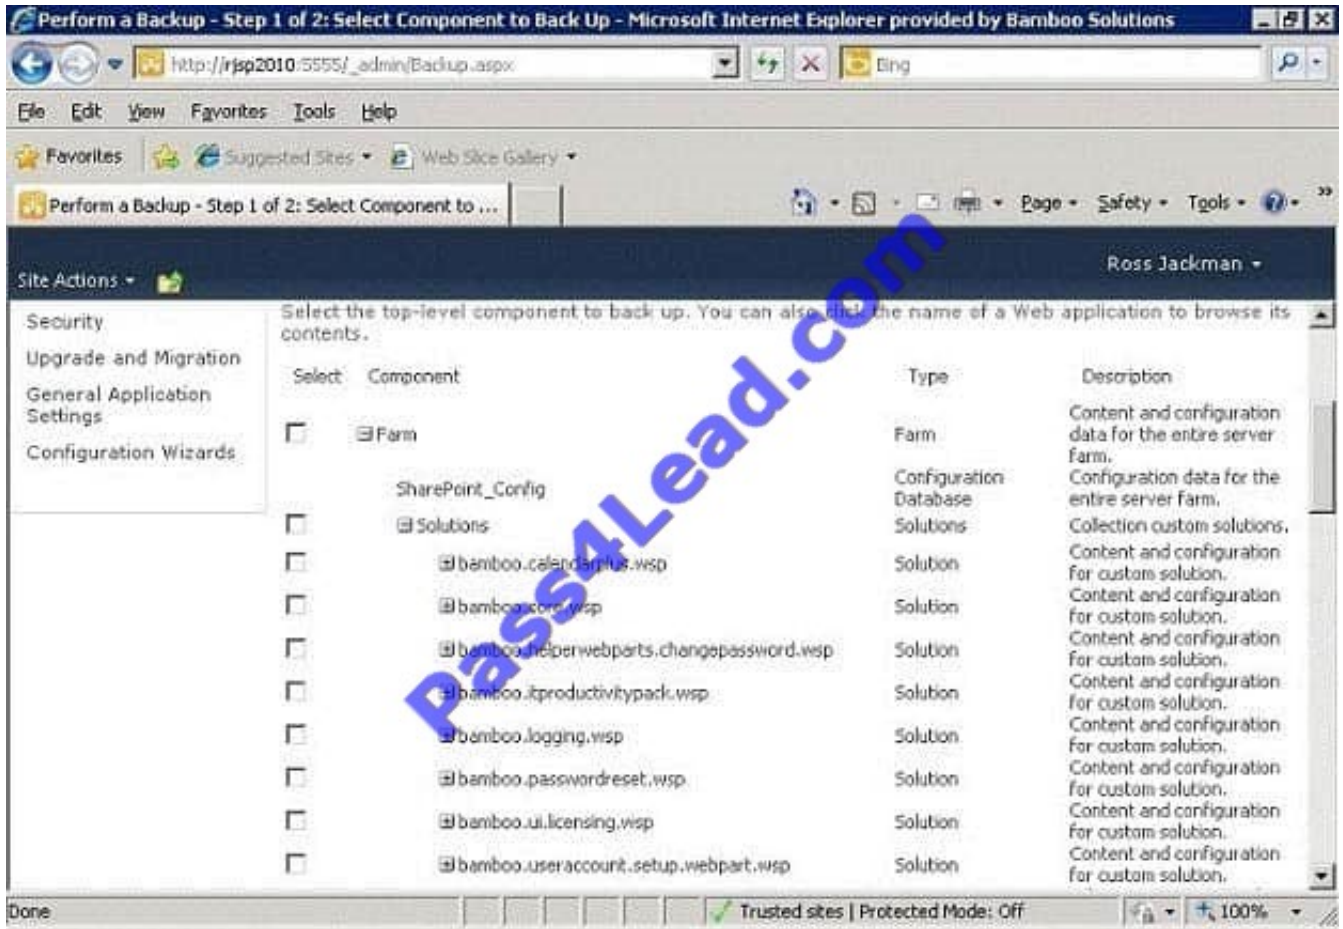

The solution must minimize the size of the backup.

What should you select from Backup and Restore in Central Administration?

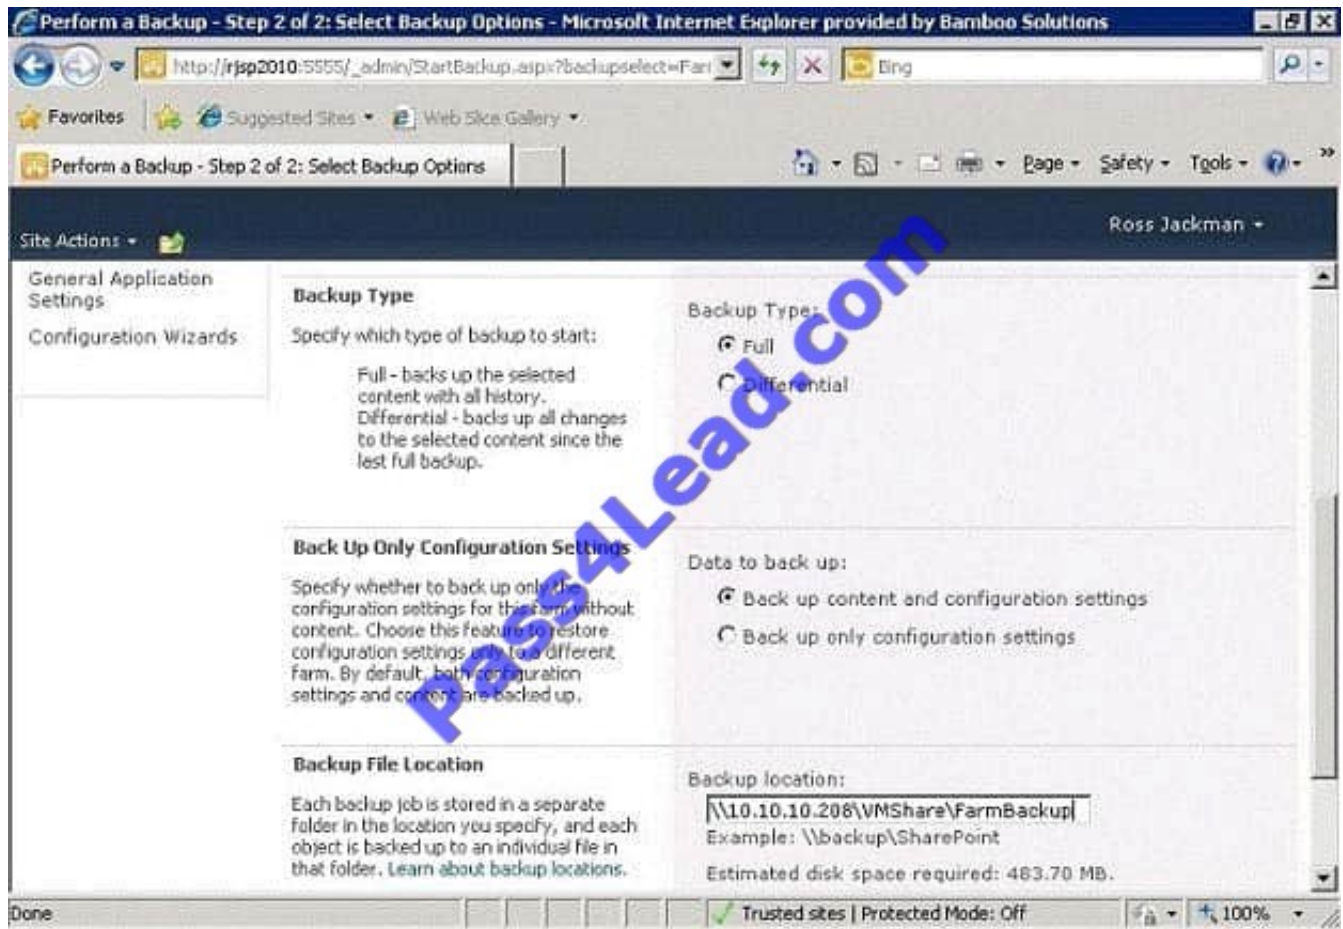

- A. From Granular Backup, click Export a site or list.
- B. From Granular Backup, click Perform a site collection backup.
- C. From Farm Backup and Restore, click Perform a backup.
- D. From Farm Backup and Restore, click Configure backup settings.

Correct Answer: C

From Central Administration -> Backup and Restore -> Farm Backup and Restore, click Perform a Backup:

On this page, components to be included in the farm backup are selected. A description of each component is included in the right-hand column. Select the components to be backed up, then click Next.

## QUESTION 5

Your network contains a server named Server1 that runs Windows Server 2008 R2. Server1 has the Streaming Media Services role and the Web Server (IIS) role installed.

You have a confidential media file.

You need to ensure that the media file streams are encrypted.

Which protocol should you configure?

- A. HTTPS
- B. IPsec
- C. Microsoft Media Server (MMS)
- D. real-time streaming protocol (RTSP)

Correct Answer: B
