QUESTION 1

You have an on-premises database.

You plan to migrate the database to Microsoft SQL Server on a Microsoft Azure virtual machine.

You move the database files to Azure.

You need to attach the database files to the SQL Server instance on the virtual machine.

The solution must ensure that you can run file snapshot backups.

How should you complete the statement? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

```
USE [master]

GO

CREATE DATABASE [Production_DB]

(  [_____▼]  = N'https://proddbsotrage-contoso.blob.core.windows.net/datafiles/prodb.mdf' )
    ┌──────────────┐
    │ DATABASE     │
    │ DISK         │
    │ FILENAME     │
    │ URL          │
    └──────────────┘

[_____▼]
┌──────────────────┐
│ FOR ATTACH;      │
│ LOG ON Prodfg;   │
│ ON PRIMARY;      │
│ ON Prodfg;       │
└──────────────────┘
```

Correct Answer:

```
USE [master]

GO

CREATE DATABASE [Production_DB]
(                       ▼    = N'https://proddbsotrage-contoso.blob.core.windows.net/datafiles/prodb.mdf' )
```

DATABASE
DISK
FILENAME
URL

FOR ATTACH;
LOG ON Prodfg;
ON PRIMARY;
ON Prodfg;

QUESTION 2

Note: This questions is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

Your company has several Microsoft Azure SQL Database instances.

Data encryption should be allowed to be implemented by the client applications that access the data. Encryption keys should not be made available to the database engine.

You need to configure the database.

What should you implement?

A. transport-level encryption

B. cell-level encryption

C. Transparent Data Encryption

D. Always Encrypted

E. Encrypting FileSystem

F. BitLocker

G. dynamic data masking

Correct Answer: A

Using encryption during transit with Azure File Shares

Azure File Storage supports HTTPS when using the REST API, but is more commonly used as an SMB file share attached to a VM.

HTTPS is a transport-level security protocol.

QUESTION 3

You administer a Microsoft SQL Server database named Sales. The database is 3 terabytes in size. The Sales database is configured as shown in the following table.

Filegroup	File
PRIMARY	• Sales.mdf
XACTIONS	• Sales_1.ndf • Sales_2.ndf • Sales_3.ndf
ARCHIVES	• SalesArch_1.ndf • SalesArch_2.ndf

You discover that all files except Sales_2.ndf are corrupt.

You need to recover the corrupted data in the minimum amount of time. What should you do?

A. Perform a file restore.

B. Perform a transaction log restore.

C. Perform a restore from a full backup.

D. Perform a filegroup restore.

Correct Answer: A

In a file restore, the goal is to restore one or more damaged files without restoring the whole database.

QUESTION 4

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution. Determine whether the solution meets stated goals.

You manage a Microsoft SQL Server environment with several databases.

You need to ensure that queries use statistical data and do not initialize values for local variables.

Solution: You enable the LEGACY_CARDINALITY_ESTIMATION option for the databases.

Does the solution meet the goal?

A. Yes

B. No

Correct Answer: B

LEGACY_CARDINALITY_ESTIMATION = { ON | OFF | PRIMARY }

Enables you to set the query optimizer cardinality estimation model to the SQL Server 2012 and earlier version independent of the compatibility level of the database. This is equivalent to Trace Flag 9481.

---

QUESTION 5

Note: This question is part of a series of questions that use the same or similar answer choices. An answer choice may be correct for more than one question in the series. Each question is independent of the other questions in this series.

Information and details provided in a question apply only to that question.

You have deployed several GS-series virtual machines (VMs) in Microsoft Azure. You plan to deploy Microsoft SQL Server in a development environment. Each VM has a dedicated disk for backups.

You need to backup a database to the local disk on a VM. The backup must be replicated to another region.

Which storage option should you use?

A. Premium P10 disk storage

B. Premium P20 diskstorage

C. Premium P30 disk storage

D. Standard locally redundant disk storage

E. Standard geo-redundant disk storage

F. Standard zone redundant blob storage

G. Standard locally redundant blob storage

H. Standard geo-redundant blob storage

Correct Answer: E

Note: SQL Database automatically creates a database backups and uses Azure readaccess geo-redundant storage (RA-GRS) to provide geo-redundancy. These backups are created automatically and at no additional charge. You don\'t need to do anything to make them happen. Database backups are an essential part of any business continuity and disaster recovery strategy because they protect your data from accidental corruption or deletion.
