QUESTION 1

Your network contains an Active Directory domain named contoso.com. The domain has Microsoft System Center 2012 Configuration Manager deployed.

You use Configuration Manager to deploy Windows updates to client computers.

Your company has several line-of-business applications deployed. The application developer uses Windows Installer patches (.msp files) to provide the company with application updates.

You need to recommend a solution to integrate the deployment of the application updates into the current update infrastructure.

What should you include in the recommendation?

A. Windows Assessment and Deployment Kit (Windows ADK)

B. Microsoft Deployment Toolkit (MDT)

C. Microsoft Security Compliance Manager

D. Microsoft System Center Updates Publisher 2011

Correct Answer: D

System Center Updates Publisher Updates Publisher 2011 is an application that can be used with System Center Configuration Manager to enable independent software vendors or line-of-business application developers and IT administrators to: Import software updates from catalogs created by non-Microsoft organizations or created from within the administrator\\'s organization Create and modify software update definitions Create applicability and deployment metadata for software updates Export software update definitions to other Updates Publisher 2011 consoles Publish software updates to a configured update server By using Updates Publisher to define software updates and publish them to the update server, administrators you can begin detecting and deploying published software updates with System Center Configuration Manager to client and server computers in your organization. New in System Center Updates Publisher 2011 An improved user interface that allows better control of managing software updates. A new automatic publication type with which Updates Publisher 2011 can query Configuration Manager to determine whether the selected software update or software update bundle is published with full content or only metadata. A new Software Update Cleanup Wizard that you can use to expire software updates that exist on the update server, but are not in the Updates Publisher 2011 repository. The ability to create Software Update bundles. The ability to define prerequisite updates and superseded updates as part of a software update definition Hyperlink

QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that runs Windows Server 2012. Server1 has the Active Directory Certificate Services server role installed and is

configured as an enterprise root certification authority (CA).

You plan to implement Encrypting File System (EFS) on all client computers.

Users use different client computers.

You need to prevent the users from receiving a different EFS certificate on each client computer.

What should you implement?

More than one answer choice may achieve the goal. Select the BEST answer.

A. Credential roaming

B. Roaming user profiles

C. PFX files on an external USB disk

D. Folder Redirection

Correct Answer: A

You must enable Credential roaming so that whatever machine a user logs on to, their credentials follow them.

This may use up extensive space in Active Directory. A certificate is enrolled to a computer where a user is logged on interactively. With credential roaming, the certificate and also the corresponding key pair are uploaded into the user\\'s object

in Active Directory about 10 seconds after certificate enrollment. If the domain consists of multiple domain controllers, Active Directory replication will make the updated user object available to all other domain controllers within the domain. If

the same user who was previously enrolled for a certificate logs on to a different computer or terminal server session, credential roaming will synchronize the user\\'s local certificate store with the certificates that are stored in Active Directory.
QUESTION 3

You have a virtual infrastructure. The infrastructure contains servers that run Windows Server 2012 and have Microsoft Application Virtualization (App-V) 5.0 installed.

You sequence an application named App1, and then assign App1 by using a Group Policy object (GPO) named GPO1.

The manufacturer of App1 releases an update named Updateappl.msi.

You need to deploy the updated version of App1 to all of the App-V 5.0 clients. The solution must ensure that all of the App-V 5.0 clients only run the updated version of Appl.

What should you do?

A. Create a new GPO, and then assign Updateapp1.msi.

B. From the App-V Sequencer, sequence Updateappl.msi, and then create a new GPO.

C. From the App-V Sequencer, update App1.appv, and then modify the GPO.

D. Create a new GPO, and then publish Updateappl.msi.

Correct Answer: B

QUESTION 4

You deploy several RemoteApp programs.

You need to identify which file extensions on a client computer are associated with the RemoteApp programs.

Which Control Panel item should you use?

To answer, select the appropriate object in the answer area.

Hot Area:

Correct Answer:

All Control Panel Items

Control Panel ▸ All Control Panel Items ▸

Search Control Panel

Adjust your computer's settings

View by: Small icons ▾

Action Center	Administrative Tools
AutoPlay	Color Management
Credential Manager	Date and Time

QUESTION 5

Your network contains an Active Directory domain named contoso.com.

You use Microsoft Application Virtualization (App-V) 5.0 to package and deploy applications to the network.

You need to deploy an application named App1. The solution must ensure that an add-on for App1 is also installed.

Which five actions should you perform?

To answer, move the five appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create a connection group.	
Sequence the add-on.	
Sequence App1.	
Publish the packages.	
Add the packages to the publishing server.	
Publish the connection group.	

Correct Answer:

Actions	Answer Area
	Sequence App1.
	Sequence the add-on.
	Add the packages to the publishing server.
Publish the packages.	Create a connection group.
	Publish the connection group.

Box 1: Sequence App1

First sequence the application.

Box 2: Sequence the add-on

Then sequence the add-on.

Box 3: Add the packages to the publishing server.

Box 4: Create a connection group.

App1 and the add-on are added to the connection group.

Box 5: Publish the connection group.

Note:

* At a high level, virtual applications management with Configuration Manager requires sequencing applications, distributing virtual applications to end-users and client devices using Configuration Manager deployments, and finally, publishing those applications for use.

* Connection Groups group one or more App-V packages to enable member applications in these packages to interact with one another while maintaining isolation from the rest of the system. This gives sequencing engineers the flexibility to maintain packages independently and removes the redundancy of adding the same application several times onto a machine.

* The Microsoft Application Virtualization (App-V) 5.0 Sequencer enables you to create the following three types of virtualized application packages:

Standard application

Add-on or plug-in

Middleware
