**QUESTION 1**

In an organization that is adding services and has an Enterprise Service Bus (ESB), the plan is to charge for the usage of those services. What should the Solution Designer recommend to capture the usage data?

- A. Add a logging feature to the service to log the individual user requests.
- B. Add logging of the messages to the ESB for post processing, insuring the user of the service is part of the logged message.
- C. Install and configure IBM Tivoli Composite Application Manager for SOA to monitor the user usage.
- D. Install and configure IBM Tivoli Usage and Accounting Manager to calculate service usage fees.

Correct Answer: C

QUESTION 2

A financial services company manages retirement accounts for its corporate clients. The company has developed Web services for account and portfolio management and has deployed an Enterprise Service Bus (ESB) to mediate access to the services from various internal applications. Recently, the company has been getting pressure from some of its clients to expose its account and portfolio Web services externally so that clients can consume and integrate these services within their own internal Web applications. The company wants to ensure that access to the services by its clients is secure and controlled so that accounts are not compromised and also wants to minimize impact to its current IT infrastructure. The company consults an SOA Designer for guidance on the solution design. Which approach should the SOA Designer suggest to handle this requirement?

- A. Allow clients access to the services via a portal that exposes only those services applicable to each client.
- B. Create a business process to route client requests to the appropriate services based on business rules.
- C. Allow service access to clients via an exposed ESB gateway that restricts access to authorized requestors only.
- D. Update the existing mediation logic in the ESB to handle the security requirements and allow external applications to access the services.

Correct Answer: C

QUESTION 3

A Fortune 100 company is migrating its Enterprise Application Integration (EAI) architecture to SOA. The intent is to begin exposing its capabilities to business partners. The CIO is thinking about building a high speed, custom messaging solution so there is capacity for future growth. What should the SOA Designer say about the long-term implications of that direction?

- A. A custom messaging solution could provide performance advantages if development priority is allocated to provide standards-based connectors and adapters for business partners to connect.
- B. XML messages can be transformed at wire speed using Enterprise Service Bus (ESB) appliances like WebSphere DataPower SOA Appliance, so it is not necessary to be concerned with that part of the system's performance.

C. Total cost of ownership will increase with custom middleware. Open standards-based commercial messaging products are more interoperable, extensible, scalable, replaceable, and reliable than custom- built systems.

D. It will take a serious commitment to detailed technical support to make this happen. It is always a tradeoff between standards-based compliance and performance. The implementation of the custom messaging will need to provide serious performance advantages to business partners.

Correct Answer: C

QUESTION 4

A company is implementing a new Web service to provide the ability to access customer details as part of a number of high-volume business processes within an SOA environment.

During the deploy phase of the SOA lifecycle, which key quality assurance activity should occur?

- A. Tracking the service in the service registry.
- B. Assessing existing services that are part of the same business processes.
- C. Simulating the business process to find the optimum path length to ensure maximum throughput.
- D. Testing to ensure that the service meets performance targets for the business processes.

Correct Answer: D

QUESTION 5

A manufacturing company has a large environment where they are using WebSphere Message Broker as their Enterprise Service Bus (ESB). For the services that are provided to partners, a standard Service Level Agreement (SLA) of four seconds has been defined for the service response time. What should be recommended to determine if the SLAs are satisfied?

- A. End-user response time monitoring should be provided.
- B. Monitor the Message Broker for response time of the services.
- C. Application Response Measurement (ARM) based monitoring should be provided.
- D. The service calls through the Message Broker ESB should be tested under load to ensure it can satisfy the requirement.

Correct Answer: B
