QUESTION 1

DRAG DROP

You schedule a planned maintenance window.

You need to perform an Azure Stack Hub update in the dev1 region. The solution must meet the technical requirements.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions

Answer Area

Complete the activities identified in the Azure Stack Hub update activity checklist.

From the administrator portal, start the update process

From a privileged endpoint (PEP) session, run the `Stop-AzureStack` and `Start-AzureStack` cmdlets.

Download the required package and import the package to the respective storage account in the dev1 region.

Notify the users of the planned maintenance.

Correct Answer:

Actions

From a privileged endpoint (PEP) session, run the `Stop-AzureStack` and `Start-AzureStack` cmdlets.

Notify the users of the planned maintenance.

Answer Area

Complete the activities identified in the Azure Stack Hub update activity checklist.

Download the required package and import the package to the respective storage account in the dev1 region.

From the administrator portal, start the update process

QUESTION 2

HOTSPOT

You plan to deploy a disconnected Azure Stack Hub integrated system.

You need to identify which type of certificate to use for the deployment and the file format for the certificate. The solution must meet the following requirements:

Minimize administrative effort.

Maximize security.

What should identify? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Hot Area:

Certificate type:

| A self-signed certificate |
| A certificate from a public certification authority (CA) |
| A certificate from an internal certification authority (CA) |

Certificate format:

| DER |
| PEM |
| PFX |

Correct Answer:

Certificate type:

| A self-signed certificate |
| A certificate from a public certification authority (CA) |
| A certificate from an internal certification authority (CA) |

Certificate format:

| DER |
| PEM |
| PFX |

Azure Stack Hub public key infrastructure (PKI) certificate requirements Azure Stack Hub has a public infrastructure network using externally accessible public IP addresses assigned to a small set of Azure Stack Hub services and possibly

tenant VMs. PKI certificates with the appropriate DNS names for these Azure Stack Hub public infrastructure endpoints are required during Azure Stack Hub deployment.

Box 1: A certificate from an internal certification authority (CA) Your Azure Stack Hub infrastructure must have network access to the certificate authority\\'s Certificate Revocation List (CRL) location published in the certificate. This CRL must be

an http endpoint. Note: for disconnected deployments, certificates issued by a public certificate authority (CA) are not supported, if the CRL endpoint is not accessible.

Features that are impaired or unavailable in disconnected deployments Azure Stack Hub was designed to work best when connected to Azure, so it\\'s important to note that there are some features and functionality that are either impaired or

completely unavailable in the disconnected mode.

Private/internal Certificate Authority (CA)

No impact - In cases where the deployment uses certificates issued by a private CA, such as an internal CA within an organization, only internal network access to the CRL endpoint is required. Internet connectivity is not required, but you

should verify that your Azure Stack Hub infrastructure has the required network access to contact the CRL endpoint defined in the certificates CDP extension.

Box 2: PFX

The certificate format must be PFX, as both the public and private keys are required for Azure Stack Hub installation. The private key must have the local machine key attribute set.

QUESTION 3

Your company is a Cloud Solution Provider (CSP).

You are planning the deployment of a multitenant Azure Stack Hub integrated system that will host internal company workloads and customer workloads.

You need to register the integrated system.

Which type of Azure subscription should you use for the registration?

A. Azure Partner Shared Services (APSS)

B. Enterprise Agreement (EA)

C. Pay-As-You-Go (PAYG)

D. CSP

Correct Answer: A

Reference:

https://docs.microsoft.com/en-us/azure-stack/operator/azure-stack-add-manage-billing-as- a-csp?view=azs-2008

QUESTION 4

You need to implement disaster recovery for the priv1 region to meet the technical requirements. Which main components should you include in the disaster recovery plan?

A. • The resource provider infrastructure
   • The App Service metering databases
   • The App Service hosting databases
   • The App Service file share
   • The App Service secrets

B. • The App Service metering databases
   • The App Service hosting databases
   • The default domain certificate
   • The CloudAdmin credentials
   • The infrastructure backup

C. • The resource provider infrastructure
   • The App Service hosting databases
   • The CloudAdmin credentials
   • The App Service file share
   • The infrastructure backup

D. • The App Service metering databases
   • The App Service hosting databases
   • The worker role virtual machine
   • The infrastructure backup
   • The App Service secrets

A. Option A

B. Option B

C. Option C

D. Option D

Correct Answer: B

QUESTION 5

HOTSPOT

You need to identify the authentication and authorization process for the integrated system in Chicago. The solution must meet the technical requirements.

What should you include in the solution? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

To configure authentication, create: ▼
| An AD FS claims provider trust |
| An AD FS relying party trust |
| An Azure AD service principal |

To configure authorizaion, use: ▼
| An Active Directory user account that has read access to Active Directory |
| An Azure AD service principal that has read access to Azure AD |
| An Azure AD user account that has read access to Azure AD |

Correct Answer:

Answer Area

To configure authentication, create: ▼
| An AD FS claims provider trust |
| An AD FS relying party trust |
| An Azure AD service principal |

To configure authorizaion, use: ▼
| An Active Directory user account that has read access to Active Directory |
| An Azure AD service principal that has read access to Azure AD |
| An Azure AD user account that has read access to Azure AD |
