QUESTION 1

A company uses an Azure VPN gateway to connect to their on-premises environment.

The company's on-premises VPN gateway is used by several services. One service is experiencing connectivity issues.

You need to minimize downtime for all services and resolve the connectivity issue.

Which three actions should you perform?

- A. Configure the hashing algorithm to be different on both gateways.
- B. Rest the VPN gateway.
- C. Configure the pre-shared key to be the same on the Azure VPN gateway and the on- premises VPN gateways.
- D. Rest the VPN connection.
- E. Configure the hashing algorithm to be the same on both gateways.
- F. Configure the pre-shared key to be different on the Azure VPN gateway and the on- premises VPN gateways.

Correct Answer: CDE

QUESTION 2

HOTSPOT

A company attempts to implement just-in-time (JIT) access for a virtual machine (VM) named VM1.

The company reports that they are unable to complete the process.

You need to implement JIT access and test the deployment.

Which PowerShell cmdlets should you run?

Hot Area:

Requirement	PowerShell cmdlet
Enable JIT VM Access on VM1	<pre>Set-AzJitNetworkAccessPolicy Start-AzJitNetworkAccessPolicy Set-AzSecuritySetting Get-AzSecuritySetting</pre>
Request JIT VM Access to VM1	<pre>Get-AzJitNetworkAccessPolicy Start-AzJitNetworkAccessPolicy Set-AzSecurityWorkspaceSetting Get-AzSecurityWorkspaceSetting</pre>

Correct Answer:

Requirement	PowerShell cmdlet
Enable JIT VM Access on VM1	<pre>Set-AzJitNetworkAccessPolicy Start-AzJitNetworkAccessPolicy Set-AzSecuritySetting Get-AzSecuritySetting</pre>
Request JIT VM Access to VM1	<pre>Get-AzJitNetworkAccessPolicy Start-AzJitNetworkAccessPolicy Set-AzSecurityWorkspaceSetting Get-AzSecurityWorkspaceSetting</pre>

QUESTION 3

HOTSPOT

A customer creates an Azure resource group named RG1 in the East US region. RG1 contains the following resources:

Resource	Name	Comments
Azure SQL Database logical server	sqlsvr1	The server uses the public IP address 40.79.153.12 and hosts a database named DB1.
Azure Virtual Network	VNET1	The network has the following subnets: subnet1 and subnet2.
Azure virtual machine (VM)	VM1	The VM connects to subnet1 and uses the private IP address 192.168.1.100.

The customer performs the following tasks:

Create a private endpoint for sqlsrv1 in subnet2 with the private IP address of 192.168.2.100.

Create a private DNS zone named privatelink.database.windows.net by using a single A record named sqlsrv1 and the IP address 192.168.2.100.

Disable public access by using the public endpoint for sqlsrv1.

The customer reports that connections from VM1 to DB1 are failing.

The solution must allow connections from VM1 to DB1 without making platform-level changes.

You need to troubleshoot and resolve the issue.

What should you do?

Hot Area:

Answer Area

Requirement	Action
Review effective routes for VM1's network interface card to determine if routing from VM1 to DB1 is properly configured.	Search for a next hop entry with the IP address of 192.168.2.100. Search for a next hop entry with the IP address of 40.79.153.12. Search for an entry with an IP address prefix that matches the Azure SQL Database service tag.
Ensure that connections from VM1 to DB1 can succeed.	Link the private DNS zone with VNET1. Update the routing table for VM1. Modify the default gateway setting for VM1.

Correct Answer:

Answer Area

Requirement	Action
Review effective routes for VM1's network interface card to determine if routing from VM1 to DB1 is properly configured.	Search for a next hop entry with the IP address of 192.168.2.100. Search for a next hop entry with the IP address of 40.79.153.12. Search for an entry with an IP address prefix that matches the Azure SQL Database service tag.
Ensure that connections from VM1 to DB1 can succeed.	Link the private DNS zone with VNET1. Update the routing table for VM1. Modify the default gateway setting for VM1.

QUESTION 4

A company migrates an on-premises Windows virtual machine (VM) to Azure. An administrator enables backups for the VM by using the Azure portal.

The company reports that the Azure VM backup job is failing.

You need to troubleshoot the issue.

Solution: Install the VM guest agent by using administrative permissions. Does the solution meet the goal?

A. Yes

B. No

Correct Answer: A

Yes, installing the VM guest agent by using administrative permissions could resolve the issue of the Azure VM backup job failing after enabling backups for the VM through the Azure portal. When backing up a virtual machine in Azure, it is

necessary to install the VM guest agent to enable proper communication between the VM and the backup service. An administrative user account is required to install the agent. Therefore, the solution mentioned in the question is correct and

the answer is A. Yes.

Reference:

Back up a virtual machine in Azure (Microsoft documentation)

QUESTION 5

HOTSPOT

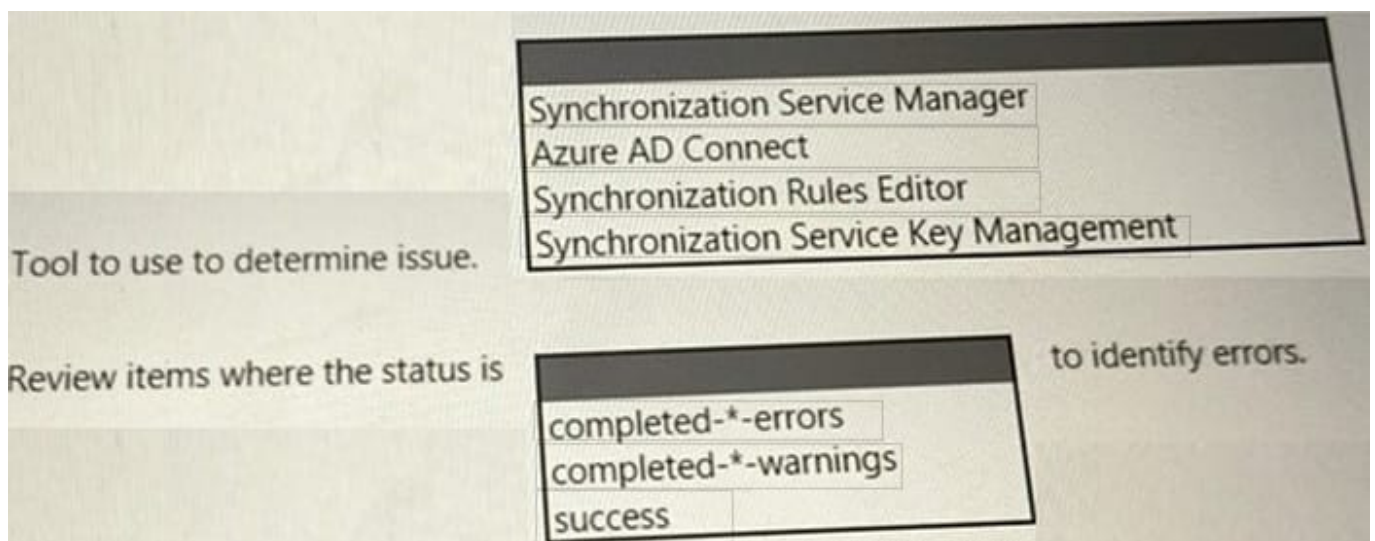

A company uses Azure Active Directory (Azure AD) for authentication. The company synchronizes Azure AD with an on-premises Active Directory domain.

The company reports that an Azure AD object fails to sync.

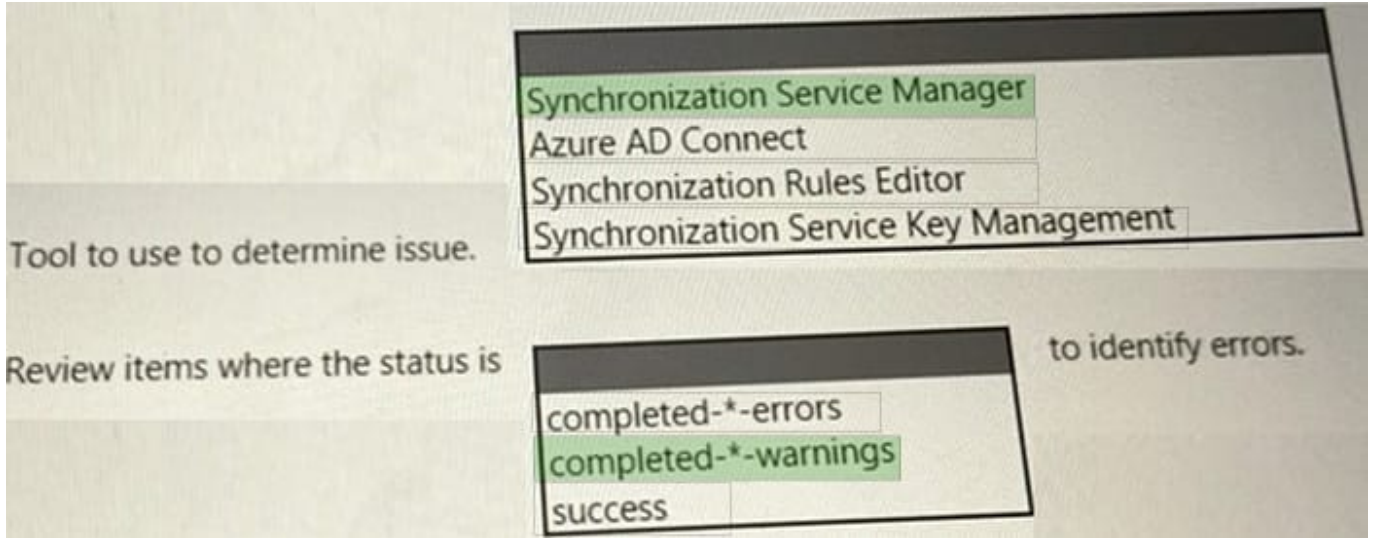

You need to determine which objects are not syncing.

Which troubleshooting steps should you use to diagnose the failure?

Hot Area:

Correct Answer:
