QUESTION 1

Despite increasing enrollments of women in medical schools, feelings of isolation among women medical students persist. Women students still have to contend with the social stereotype of a male doctor. In addition, institutions themselves may unintentionally foster feelings of separateness. Comparatively few women are hired for faculty positions, thus offering women students few role models. The pervasive sexual humor of male doctors and students further intensifies women students' alienation. Alienation, in turn, negatively affects individual self-perception. As women enter medical study in increasing numbers, they may feel less at odds with their peers and the teaching establishment. Institutional bias will, no doubt, also change in response to evolving societal values. However, we should not wait passively for gradual social processes to bring changes; schools must provide current students with support services designed to meet women's needs. In a recent study, 48 percent of the women questioned rated a student support group as the most important support service a school can provide.

The passage suggests that which of the following would be likely to reduce the isolation felt by women medical students?

- A. An increased proportion of women in medical schools.
- B. A decrease in the number of women filling faculty positions in medical schools.
- C. A decrease in support services available to women students.
- D. A more complete segregation between men and women in medical schools.

Correct Answer: A

QUESTION 2

The chemical $4[\text{NH}_4\text{Fe}(\text{SO}_4)_2 \times 12\text{H}]$ contains how many more hydrogen atoms than oxygen atoms?
