QUESTION 1

When giving an intramuscular injection to an infant. Which of the following sites is preferred?

- A. Ventrogluteal region
- B. Deltoid
- C. Vastus lateralis
- D. Dorsogluteal region

Correct Answer: C

Vastus lateralis is the ideal choice for infants.

QUESTION 2

The NSAID that is comparable to morphine in efficacy is _____.

- A. Feldene
- B. Stodal
- C. Toradol
- D. Elavil

Correct Answer: C

Toradol is the first injectable NSAID equal to morphine in efficacy.

QUESTION 3

Which statement about glaucoma is true and accurate?

- A. Acute angle-closure glaucoma is an ocular emergency.
- B. Acute angle-closure glaucoma leads to the loss of peripheral vision and tunnel vision.
- C. Primary open-angle glaucoma leads to eye pain, nausea and vomiting, blurry vision and halos.
- D. Bubbles are implanted to protect the retina from the glaucoma.

Correct Answer: A

Acute angle-closure glaucoma is an ocular emergency and it is characterized with eye pain, nausea and vomiting, blurry vision and halos.

The signs and symptoms of primary open-angle glaucoma are the loss of peripheral vision and tunnel

vision.

Bubbles are placed to treat retinal detachments, another ocular emergency and laser peripheral iridotomy to decrease intraocular pressure is used for the treatment of glaucoma.

QUESTION 4

The intravenous route is potentially the most dangerous route of drug administration because _____.

- A. the IV might infiltrate
- B. it is expensive and nursing intensive
- C. rapid administration of a drug can lead to toxicity
- D. the client always has more side effects

Correct Answer: C

The bioavailability of the injected medication is 100% and might lead to toxicity.

An IV infiltration can cause serious problems with tissue necrosis, but this is not life threatening.

Expensive and time consuming do not equate with dangerous.

Choice "the client always has more side effects" is not always true.

QUESTION 5

The nurse provides a postoperative client with an analgesic medication and darkens the room before the client goes to sleep for the night.

The nurse's actions _____.

- A. help the client's circadian rhythm
- B. stimulate hormonal changes in the brain
- C. decrease stimuli from the cerebral cortex
- D. alert the hypothalamus in the brain

Correct Answer: C

Reduction of environmental stimuli (particularly light and noise) from the cerebral cortex (which can be an area of arousal) facilitates sleep.

Sleep occurs when there is a decreased input into this area.
